具有通用输入的 LMK00101 超低抖动 LVCMOS 扇出缓冲器/电平转换器

查询样品: **LMK00101**

特性

- **10** 个低电压互补金属氧化物半导体/低压晶体管-晶体管逻辑 **(LVCMOS/LVTTL)** 输出，**DC** 达到 **200MHz**
- 通用输入
  - 低电压正射极耦合逻辑 **(LVPECL)**
  - 低压差分信令 **(LVDS)**
  - 主机时钟信号电平 **(HCSL)**
  - 短截线串联端接逻辑 **(SSTL)**
  - **LVCMOS/LVTTL**
- 晶体振荡器接口
  - 晶振输入频率：**10** 至 **40MHz**
- 输出偏斜：**6ps**
- 附加相位抖动
  - **156.25MHz**（**12kHz** 至 **20MHz**）时为 **30fs**
- 低传播延迟
- 内核运行电源电压 **3.3V** 或 **2.5V**
- 可调输出电源
  - 每组 **1.5V**，**1.8V**，**2.5V** 和 **3.3V**
- **32** 引脚超薄四方扁平无引线封装 **(WQFN) 5.0 x 5.0 x 0.8mm**

目标应用

- 针对射频拉远单元 **(RRU)** 应用的 **LO** 基准分布
- 同步光网络 **(SONET)**，以太网，光纤信道线路接口卡
- 光传输网络
- 千兆无源光网络 **(GPON)** 光线路终端 **(OLT) /** 光网络单元 **(ONU)**
- 服务器和存储局域网络互连
- 医疗成像
- 便携式测试和测量
- 高端 **A/V**

说明

LMK00101 是一款高新能、低噪声 LVCMOS 扇出缓冲器，此缓冲器能够从一个差分、单端或晶振输入中分配 10 个超低抖动时钟。 LMK00101 支持针对无毛刺脉冲运行的同步输出使能。 超低偏斜、低抖动和高电源抑制比 (PSRR) 使得这个缓冲器非常适合于多种网络互连，电信，服务器和存储局域网络互连，RRU LO 基准分布，医疗和测试设备应用。

内核电压可被设定为 2.5V 或者 3.3V，而输出电压可被设定为 1.5V，1.8V，2.5V 或者 3.3V。可通过引脚编程轻松地对 LMK00101 进行配置。

PIN DESCRIPTIONS

Pin #	Pin Name	Type	Description
DAP	DAP	-	The DAP should be grounded
1	CLKout0	Output	LVCMOS Output
2, 6	Vddo	Power	Power Supply for Bank A (CLKout0 to CLKout4) CLKout pins.
19,23	Vddo	Power	Power Supply for Bank B (CLKout5 to CLKout9) CLKout pins.
3	CLKout1	Output	LVCMOS Output
4,9,15,16, 21,25,26,32	GND	GND	Ground
5	CLKout2	Output	LVCMOS Output
7	CLKout3	Output	LVCMOS Output
8	CLKout4	Output	LVCMOS Output
10	Vdd	Power	Supply for operating core and input buffer
11	OSCin	Input	Input for Crystal
12	OSCout	Output	Output for Crystal
13	CLKin0	Input	Input Pin
14	CLKin0*	Input	Complementary input pin
17	CLKout5	Output	LVCMOS Output
18	CLKout6	Output	LVCMOS Output
20	CLKout7	Output	LVCMOS Output
22	CLKout8	Output	LVCMOS Output
24	CLKout9	Output	LVCMOS Output
27	CLKin1*	Input	Complementary Input Pin
28	CLKin1	Input	Input Pin
29	SEL1	Input	MSB for Input Clock Selection. This pin has an internal pull-down resistor. [1]
30	SEL0	Input	LSB for Input Clock Selection. This pin has an internal pull-down resistor. [1]
31	OE	Input	Output Enable. This pin has an internal pull-down resistor. [1]

(1) CMOS control input with internal pull-down resistor.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ABSOLUTE MAXIMUM RATINGS[1][2][3]

Parameter	Symbol	Ratings	Units
Core Supply Voltage	Vdd	-0.3 to 3.6	V
Output Supply Voltage	Vddo	-0.3 to 3.6	V
Input Voltage	V_{IN}	-0.3 to Vdd + 0.3	V
Storage Temperature Range	T_{STG}	-65 to 150	°C
Lead Temperature (solder 4 s)	T_L	+260	°C
Junction Temperature	T_J	+125	°C

(1)   "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions.
(2)   This device is a high performance integrated circuit with ESD handling precautions. Handling of this device should only be done at ESD protected work stations. The device is rated to a HBM-ESD of > 2.5 kV, a MM-ESD of > 250 V, and a CDM-ESD of > 1 kV.
(3)   If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.

RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Units
Ambient Temperature	T_A	-40	25	85	°C
Core Supply Voltage	Vdd	2.375	3.3	3.45	V
Output Supply Voltage [1]	Vddo	1.425	3.3	Vdd	V

(1) V_{ddo} should be less than or equal to V_{dd} ($V_{ddo} \leq V_{dd}$)

PACKAGE THERMAL RESISTANCE

32-Lead WQFN

Package	Symbols	Ratings	Units
Thermal resistance from junction to ambient on 4-layer Jedec board [1]	θ_{JA}	50	° C/W
Thermal resistance from junction to case [2]	$\theta_{JC\ (DAP)}$	20	° C/W

(1)   Specification assumes 5 thermal vias connect to die attach pad to the embedded copper plane on the 4-layer Jedec board. These vias play a key role in improving the thermal performance of the QFN. For best thermal dissipation it is recommended that the maximum number of vias be used on the board layout.
(2)   Case is defined as the DAP (die attach pad).

ELECTRICAL CHARACTERISTICS

(2.375 V ≤ Vdd ≤ 3.45 V, 1.425 ≤ Vddo ≤ Vdd, -40 °C ≤ T_A ≤ 85 °C, Differential inputs. Typical values represent most likely parametric norms at Vdd = Vddo = 3.3 V, T_A = 25 °C, at the Recommended Operation Conditions at the time of product characterization and are not ensured). Test conditions are: F_{test} = 100 MHz, Load = 5 pF in parallel with 50 Ω unless otherwise stated.

MEASUREMENT DEFINITIONS

Differential Voltage Measurement Terminology

The differential voltage of a differential signal can be described by two different definitions causing confusion when reading datasheets or communicating with other engineers. This section will address the measurement and description of a differential signal so that the reader will be able to understand and discern between the two different definitions when used.

The first definition used to describe a differential signal is the absolute value of the voltage potential between the inverting and non-inverting signal. The symbol for this first measurement is typically V_{ID} or V_{OD} depending on if an input or output voltage is being described.

The second definition used to describe a differential signal is to measure the potential of the non-inverting signal with respect to the inverting signal. The symbol for this second measurement is V_{SS} and is a calculated parameter. Nowhere in the IC does this signal exist with respect to ground, it only exists in reference to its differential pair. V_{SS} can be measured directly by oscilloscopes with floating references, otherwise this value can be calculated as twice the value of V_{OD} as described in the first section

Figure 7 illustrates the two different definitions side-by-side for inputs and Figure 8 illustrates the two different definitions side-by-side for outputs. The V_{ID} and V_{OD} definitions show V_A and V_B DC levels that the non-inverting and inverting signals toggle between with respect to ground. V_{SS} input and output definitions show that if the inverting signal is considered the voltage potential reference, the non-inverting signal voltage potential is now increasing and decreasing above and below the non-inverting reference. Thus the peak-to-peak voltage of the differential signal can be measured.

V_{ID} and V_{OD} are often defined in volts (V) and V_{SS} is often defined as volts peak-to-peak (V_{PP}).

Figure 7. Two Different Definitions for Differential Input Signals

Figure 8. Two Different Definitions for Differential Output Signals

FUNCTIONAL DESCRIPTION

The LMK00101 is a 10 output LVCMOS clock fanout buffer with low additive jitter that can operate up to 200 MHz. It features a 3:1 input multiplexer with a crystal oscillator input, single supply or dual supply (lower power) operation, and pin-programmable device configuration. The device is offered in a 32-pin WQFN package.

V_{dd} and V_{ddo} Power Supplies

Separate core and output supplies allow the output buffers to operate at the same supply as the Vdd core supply (3.3 V or 2.5 V) or from a lower supply voltage (3.3 V, 2.5 V, 1.8 V, or 1.5 V). Compared to single-supply operation, dual supply operation enables lower power consumption and output-level compatibility.

Bank A (CLKout0 to CLKout4) and Bank B (CLKout5 to CLKout9) may also be operated at different V_{ddo} voltages, provided neither V_{ddo} voltage exceeds V_{dd}.

NOTE

Care should be taken to ensure the V_{ddo} voltage does not exceed the Vdd voltage to prevent turning-on the internal ESD protection circuitry.

DO NOT DISCONNECT OR GROUND ANY OF THE V_{ddo} PINS as the V_{ddo} pins are internally connected within an output bank.

CLOCK INPUTS

The LMK00101 has three different inputs, CLKin0/CLKin0*, CLKin1/CLKin1*, and OSCin that can be driven in different manners that are described in the following sections.

SELECTION OF CLOCK INPUT

Clock input selection is controlled using the SEL0 and SEL1 pins as shown in Table 1. Refer to Driving the Clock Inputs for clock input requirements. When CLKin0 or CLKin1 is selected, the crystal circuit is powered down. When OSCin is selected, the crystal oscillator will start-up and its clock will be distributed to all outputs. Refer to Crystal Interface for more information. Alternatively, OSCin may be driven by a single ended clock, up to 200 MHz, instead of a crystal.

Table 1. Input Selection

SEL1	SEL0	Input
0	0	CLKin0, CLKin0*
0	1	CLKin1, CLKin1*
1	X	OSCin (Crystal Mode)

CLKin/CLKin Pins*

The LMK00101 has two differential inputs (CLKin0/CLKin0* and CLKin1/CLKin1*) that can be driven single-ended or differentially. They can accept AC or DC coupled 3.3V/2.5V LVPECL, LVDS, or other differential and singled ended signals that meet the input requirements under the "CLKin0/0* and CLKin1/1* Input Clock Specifications" portion of the ELECTRICAL CHARACTERISTICS and [1]. Refer to Driving the Clock Inputs for more details on driving the LMK00101 inputs.

In the event that a Crystal mode is not selected and the CLKin pins do not have an AC signal applied to them, Table 2 following will be the state of the outputs.

[1] When using differential signals with V_{CM} outside of the acceptable range for the specified V_{ID}, the clock must be AC coupled.

Table 2. CLKinX Input vs. Output States

CLKinX	CLKinX*	Output State
Open	Open	Logic Low
Logic Low	Logic Low	Logic Low
Logic High	Logic Low	Logic High
Logic Low	Logic High	Logic Low

OSCin/OSCout Pins

The LMK00101 has a crystal oscillator which will be powered up when OSCin is selected. Alternatively, OSCin may be driven by a single ended clock, up to 200 MHz, instead of a crystal. Refer to Crystal Interface for more information.

If Crystal mode is selected and the pins do not have an AC signal applied to them, Table 3 will be the state of the outputs. If Crystal mode is selected an open state is not allowed on OSCin, as the outputs may oscillate due to the crystal oscillator circuitry.

Table 3. OSCin Input vs. Output States

OSCin	Output State
Open	Not Allowed
Logic Low	Logic High
Logic High	Logic Low

CLOCK OUTPUTS

The LMK00101 has 10 LVCMOS outputs.

Output Enable Pin

When the output enable pin is held High, the outputs are enabled. When it is held Low, the outputs are held in a Low state as shown in Table 4.

Table 4. Output Enable Pin States

OE	Outputs
Low	Disabled (Hi-Z)
High	Enabled

The OE pin is synchronized to the input clock to ensure that there are no runt pulses. When OE is changed from Low to High, the outputs will initially have an impedance of about 400 Ω to ground until the second falling edge of the input clock. Starting with the second falling edge of the input clock, the outputs will buffer the input. If the OE pin is taken from Low to High when there is no input clock present, the outputs will either go High or Low and stay a that state; they will not oscillate. When the OE pin is taken from High to Low the outputs will become Low after the second falling edge of the clock input and then will go to a Disabled (Hi-Z) state starting after the next rising edge.

Using Less than Ten Outputs

Although the LMK00101 has 10 outputs, not all applications will require all of these. In this case, the unused outputs should be left floating with a minimum copper length to minimize capacitance. In this way, this output will consume minimal output current because it has no load.

NOTE
For best soldering practices, the minimum trace length should extend to include the pin solder mask. This way during reflow, the solder has the same copper area as connected pins. This allows for good, uniform fillet solder joints helping to keep the IC level during reflow.

APPLICATION INFORMATION

Driving the Clock Inputs

The LMK00101 has two differential inputs (CLKin0/CLKin0* and CLKin1/CLKin1*) that can accept AC or DC coupled 3.3V/2.5V LVPECL, LVDS, and other differential and single ended signals that meet the input requirements specified in ELECTRICAL CHARACTERISTICS. The device can accept a wide range of signals due to its wide input common mode voltage range (V_{CM}) and input voltage swing (V_{ID})/dynamic range. AC coupling may also be employed to shift the input signal to within the V_{CM} range.

To achieve the best possible phase noise and jitter performance, it is recommended that the input have a high slew rate of 2 V/ns(differential) or higher. Driving the input with a lower slew rate will degrade the noise floor and jitter. For this reason, a differential input signal is recommended over single-ended because it typically provides higher slew rate and common-mode noise rejection.

While it is recommended to drive the CLKin/CLKin* pair with a differential signal input, it is possible to drive it with a single-ended clock provided it conforms to the Single-Ended Input specifications for CLKin pins listed in the Electrical Characteristics. For large single-ended input signals, such as 3.3V or 2.5V LVCMOS, a 50 Ω load resistor should be placed near the input for signal attenuation to prevent input overdrive as well as for line termination to minimize reflections. The CLKin input has an internal bias voltage of about 1.4 V, so the input can be AC coupled as shown in Figure 9. The output impedance of the LVCMOS driver plus Rs should be close to 50 Ω to match the characteristic impedance of the transmission line and load termination.

Figure 9. Preferred Configuration: Single-Ended LVCMOS Input, AC Coupling, Near and Far End Termination

A single-ended clock may also be DC coupled to CLKinX as shown in Figure 10. A 50-Ω load resistor should be placed near the CLKinX input for signal attenuation and line termination. Because half of the single-ended swing of the driver ($V_{O,PP}$ / 2) drives CLKinX, CLKinX* should be externally biased to the midpoint voltage of the attenuated input swing (($V_{O,PP}$ / 2) × 0.5). The external bias voltage should be within the specified input common voltage (V_{CM}) range. This can be achieved using external biasing resistors in the kΩ range (R_{B1} and R_{B2}) or another low-noise voltage reference. This will ensure the input swing crosses the threshold voltage at a point where the input slew rate is the highest.

Figure 10. Single-Ended LVCMOS Input, DC Coupling with Common Mode Biasing

If the crystal oscillator circuit is not used, it is possible to drive the OSCin input with an single-ended external clock as shown in Figure 11. The input clock should be AC coupled to the OSCin pin, which has an internally generated input bias voltage, and the OSCout pin should be left floating. While OSCin provides an alternative input to multiplex an external clock, it is recommended to use either differential input (CLKinX) since it offers higher operating frequency, better common mode, improved power supply noise rejection, and greater performance over supply voltage and temperature variations.
Figure 11. Driving OSCin with a Single-Ended External Clock

Crystal Interface

The LMK00101 has an integrated crystal oscillator circuit that supports a fundamental mode, AT-cut crystal. The crystal interface is shown in Figure 12.

Figure 12. Crystal Interface

The load capacitance (C_L) is specific to the crystal, but usually on the order of 18 to 20 pF. While C_L is specified for the crystal, the OSCin input capacitance (C_{IN} = 1 pF typical) of the device and PCB stray capacitance (C_{STRAY} ~ 1 to 3 pF) can affect the discrete load capacitor values, C_1 and C_2. For the parallel resonant circuit, the discrete capacitor values can be calculated as follows:

$$C_L = (C_1 * C_2) / (C_1 + C_2) + C_{IN} + C_{STRAY} \tag{1}$$

Typically, $C_1 = C_2$ for optimum symmetry, so Equation 1 can be rewritten in terms of C_1only:

$$C_L = C_1{}^2 / (2 * C_1) + C_{IN} + C_{STRAY} \tag{2}$$

Finally, solve for C_1:

$$C_1 = (C_L - C_{IN} - C_{STRAY}) * 2 \tag{3}$$

ELECTRICAL CHARACTERISTICS provides crystal interface specifications with conditions that ensure start-up of the crystal, but it does not specify crystal power dissipation. The designer will need to ensure the crystal power dissipation does not exceed the maximum drive level specified by the crystal manufacturer. Overdriving the crystal can cause premature aging, frequency shift, and eventual failure. Drive level should be held at a sufficient level necessary to start-up and maintain steady-state operation.

The power dissipated in the crystal, P_{XTAL}, can be computed by:

$$P_{XTAL} = I_{RMS}^2 * R_{ESR} * (1 + C_0 / C_L)^2$$

Where:

- I_{RMS} is the RMS current through the crystal.
- R_{ESR} is the maximum equivalent series resistance specified for the crystal.
- C_L is the load capacitance specified for the crystal.
- C_0 is the minimum shunt capacitance specified for the crystal. (4)

I_{RMS} can be measured using a current probe (e.g. Tektronix CT-6 or equivalent) placed on the leg of the crystal connected to OSCout with the oscillation circuit active.

As shown in Figure 12, an external resistor, R_{LIM}, can be used to limit the crystal drive level if necessary. If the power dissipated in the selected crystal is higher than the drive level specified for the crystal with R_{LIM} shorted, then a larger resistor value is mandatory to avoid overdriving the crystal. However, if the power dissipated in the crystal is less than the drive level with R_{LIM} shorted, then a zero value for R_{LIM} can be used. As a starting point, a suggested value for R_{LIM} is 1.5 kΩ

Power Supply Ripple Rejection

In practical system applications, power supply noise (ripple) can be generated from switching power supplies, digital ASICs or FPGAs, etc. While power supply bypassing will help filter out some of this noise, it is important to understand the effect of power supply ripple on the device performance. When a single-tone sinusoidal signal is applied to the power supply of a clock distribution device, such as LMK00101, it can produce narrow-band phase modulation as well as amplitude modulation on the clock output (carrier). In the singleside band phase noise spectrum, the ripple-induced phase modulation appears as a phase spur level relative to the carrier (measured in dBc).

For the LMK00101, power supply ripple rejection (PSRR), was measured as the single-sideband phase spur level (in dBc) modulated onto the clock output when a ripple signal was injected onto the V_{ddo} supply. The PSRR test setup is shown in Figure 13.

Figure 13. PSRR Test Setup

A signal generator was used to inject a sinusoidal signal onto the V_{ddo} supply of the DUT board, and the peak-to-peak ripple amplitude was measured at the V_{ddo} pins of the device. A limiting amplifier was used to remove amplitude modulation on the differential output clock and convert it to a single-ended signal for the phase noise analyzer. The phase spur level measurements were taken for clock frequencies of 100 MHz under the following power supply ripple conditions:

- Ripple amplitude: 100 mVpp on V_{ddo} = 2.5 V
- Ripple frequency: 100 kHz

Assuming no amplitude modulation effects and small index modulation, the peak-to-peak deterministic jitter (DJ) can be calculated using the measured single-sideband phase spur level (PSRR) as follows:

$$DJ \text{ (ps pk-pk)} = [(2 * 10^{(PSRR/20)}) / (\pi * f_{clk})] * 10^{12}$$ (5)

Power Supply Bypassing

The V_{dd} and V_{ddo} power supplies should have a high frequency bypass capacitor, such as 100 pF, placed very close to each supply pin. Placing the bypass capacitors on the same layer as the LMK00101 improves input sensitivity and performance. All bypass and decoupling capacitors should have short connections to the supply and ground plane through a short trace or via to minimize series inductance.

Thermal Management

For reliability and performance reasons the die temperature should be limited to a maximum of 125 °C. That is, as an estimate, T_A (ambient temperature) plus device power consumption times θ_{JA} should not exceed 125 °C.

The package of the device has an exposed pad that provides the primary heat removal path as well as excellent electrical grounding to a printed circuit board. To maximize the removal of heat from the package a thermal land pattern including multiple vias to a ground plane must be incorporated on the PCB within the footprint of the package. The exposed pad must be soldered down to ensure adequate heat conduction out of the package.

A recommended land and via pattern is shown in Figure 14. More information on soldering WQFN (formerly referred to as LLP) packages and gerber footprints can be obtained: http://www.ti.com/packaging

To minimize junction temperature it is recommended that a simple heat sink be built into the PCB (if the ground plane layer is not exposed). This is done by including a copper area of about 2 square inches on the opposite side of the PCB from the device. This copper area may be plated or solder coated to prevent corrosion but should not have conformal coating (if possible), which could provide thermal insulation. The vias shown in Figure 14 should connect these top and bottom copper layers and to the ground layer. These vias act as "heat pipes" to carry the thermal energy away from the device side of the board to where it can be more effectively dissipated.

Figure 14. Recommended Land and Via Pattern

REVISION HISTORY

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMK00101SQ/NOPB	ACTIVE	WQFN	RTV	32	1000	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	K00101	Samples
LMK00101SQE/NOPB	ACTIVE	WQFN	RTV	32	250	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	K00101	Samples
LMK00101SQX/NOPB	ACTIVE	WQFN	RTV	32	2500	Green (RoHS & no Sb/Br)	CU SN	Level-1-260C-UNLIM	-40 to 85	K00101	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息,并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内,且 TI 认为 有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定,否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应 用相关的风险,客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予 的直接或隐含权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息,不能构成从 TI 获得使用这些产品或服 务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可,或是 TI 的专利权或其它 知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分,仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况 下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时,如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分,则会失去相关 TI 组件 或服务的所有明示或暗示授权,且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意,尽管任何应用相关信息或支持仍可能由 TI 提供,但他们将独力负责满足与其产品及在其应用中使用 TI 产品 相关的所有法律、法规和安全相关要求。客户声明并同意,他们具备制定与实施安全措施所需的全部专业技术和知识,可预见 故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因 在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中,为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特 有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此,此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III(或类似的生命攸关医疗设备)的授权许可,除非各方授权官员已经达成了专门管控此类使 用的特别协议。

只有那些 TI 特别注明属于军用等级或"增强型塑料"的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同 意,对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用,其风险由客户单独承担,并且由客户独 力负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品,这些产品主要用于汽车。在任何情况下,因使用非指定产品而无法达到 ISO/TS16949 要求,TI不承担任何责任。
