

LMK00306 3GHz 6 路输出超低附加抖动 差动时钟缓冲器/电平转换器

1 特性

- 3: 1 输入多路复用器
 - 两个通用输入运行频率高达 3.1GHz，并且接受低电压正射极耦合逻辑 (LVPECL)，低压差分信令 (LVDS)，电流模式逻辑 (CML)，短截线串联端接逻辑 (SSTL)，高速收发器逻辑 (HSTL)，主机时钟信号电平 (HCSL) 或单端时钟
 - 一个晶振输入可接受 10 至 40MHz 的晶振或单端使能时钟
- 两组差分输出，每组 3 个
 - LVPECL, LVDS, HCSL 或高阻抗 (Hi-Z) (每个组可选)
 - LMK03806 时钟源为 156.25MHz 时，LVPECL 附加抖动：
 - 20fs RMS (10kHz 至 1MHz)
 - 51fs RMS (12kHz 至 20MHz)
- 高电源抑制比 (PSRR): 156.25MHz 时为 -65/-76dBc (LVPECL/LVDS)
- 具有同步使能驱动的 LVCMOS 输出
- 由引脚控制的配置
- V_{CC} 内核电源: $3.3V \pm 5\%$
- 3 个独立的 V_{CCO} 输出电源: $3.3V/2.5V \pm 5\%$
- 工业温度范围: $-40^{\circ}C$ 至 $+85^{\circ}C$
- 36 接线超薄型四方扁平无引线 (WQFN) 封装 (6mm x 6mm)

2 应用

- 针对模数转换器 (ADC)，数模转换器 (DAC)，多千兆以太网，XAUI，光纤通道，SATA/SAS，SONET/SDH，通用公共无线接口 (CPRI)，高频背板的时钟分配和电平转换
- 交换机、路由器、线路接口卡、定时卡
- 服务器，计算，PCI Express (PCIe 3.0)
- 射频拉远单元和基站单元

3 说明

LMK00306 是一款 3GHz、6 路输出差动扇出缓冲器，用于高频、低抖动时钟/数据分配和电平转换。可从两个通用输入或一个晶振输入中选择输入时钟。所选择的输入时钟被分配到两组输出，每组输出包含 3 个差分输出和 1 个 LVCMOS 输出。两个差分输出组可被独立配置为 LVPECL, LVDS 或 HCSL 驱动器，或者被禁用。LVCMOS 输出具有用于在启用或禁用时实现无短脉冲运行的同步使能输入。LMK00306 由一个 3.3V 内核电源和 3 个独立的 3.3V/2.5V 输出电源供电运行。

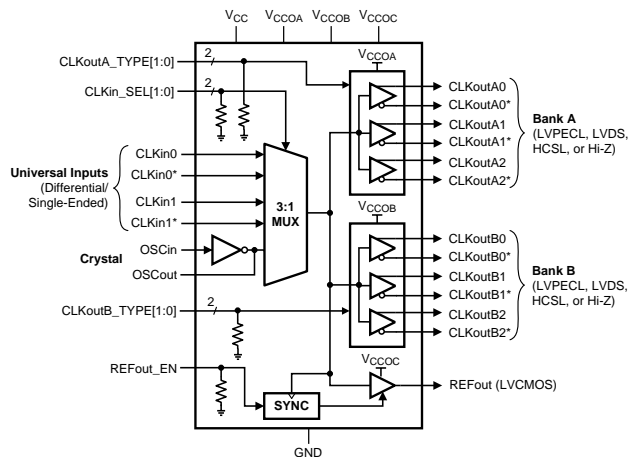

LMK00306 具有高性能、多用途和电源效率特性，这使得它成为替代固定输出缓冲器器件的理想选择，同时还能增加系统中的时序余裕。

器件信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
LMK00306	WQFN (36)	6.00mm x 6.00mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision C (May 2013) to Revision D

Page

•	已添加“超低附加抖动”至文档标题	1
•	已添加、更新或重命名以下部分：规范；详细 说明；应用和实施；电源相关建议；器件和文档支持；机械、封装和订购信息	1
•	Changed Cin (typ) from 1 pF to 4 pF (based on updated test method) in <i>Electrical Characteristics: Crystal Interface</i>	8
•	Added footnote for V_{LSE} parameter in the <i>Electrical Characteristics</i> table.	8
•	Added “Additive RMS Jitter, Integration Bandwidth 10 kHz to 20 MHz” parameter with 100 MHz and 156.25 MHz Test conditions, Typical values, Max values, and footnotes in Electrical Characteristics: LVPECL Outputs	9
•	Added “Additive RMS Jitter, Integration Bandwidth 10 kHz to 20 MHz” parameter with 100 MHz and 156.25 MHz Test conditions, Typical values, Max values, and footnotes in Electrical Characteristics: LVDS Outputs	10
•	Added new paragraph at end of <i>Driving the Clock Inputs</i>	22
•	Changed "LMK00301" to LMK00306" in Figure 27 and Figure 28	23
•	Changed Cin = 4 pF (typ, based on updated test method) in <i>Crystal Interface</i>	23
•	Added Power Supply Sequencing	29

Changes from Revision B (February 2013) to Revision C

Page

•	已更改 目标 应用，添加了附加 应用 至第二个要点和第三个要点，并从第一个要点中删除了高速和并行接口。	1
•	Changed V_{CM} text to condition for VIH to VCM parameter group.	8
•	Deleted V_{IH} min value from Electrical Characteristics table.	8
•	Deleted V_{IL} max value from Electrical Characteristics table.....	8
•	Added V_{LSE} parameter and spec limits with corresponding table note to Electrical Characteristics Table.	8
•	Changed third paragraph in Driving the Clock Inputs section to include CLKin* and LVCMOS text. Revised to better correspond with information in Electrical Characteristics Table.	22
•	Changed bypass cap text to signal attenuation text of the fourth paragraph in <i>Driving the Clock Inputs</i> section.	22
•	Changed <i>Single-Ended LVCMOS Input, DC Coupling with Common Mode Biasing</i> image with revised graphic.....	23
•	Added text to second paragraph of <i>Termination for AC Coupled Differential Operation</i> to explain graphic update to	

<i>Differential LVDS Operation with AC Coupling to Receivers.</i>	26
• <i>Changed graphic for Differential LVDS Operation, AC Coupling, No Biasing by the Receiver and updated caption.</i>	26

5 Pin Configuration and Functions

Pin Functions⁽¹⁾

PIN		TYPE	DESCRIPTION
NO.	NAME		
DAP	DAP	GND	Die Attach Pad. Connect to the PCB ground plane for heat dissipation.
1, 19, 28	GND	GND	Ground
2, 5	V _{CCOA}	PWR	Power supply for Bank A Output buffers. V _{CCOA} can operate from 3.3 V or 2.5 V. The V _{CCOA} pins are internally tied together. Bypass with a 0.1 uF low-ESR capacitor placed very close to each V _{cco} pin. ⁽²⁾
3, 4	CLKoutA0, CLKoutA0*	O	Differential clock output A0. Output type set by CLKoutA_TYPE pins.
6, 7	CLKoutA1, CLKoutA1*	O	Differential clock output A1. Output type set by CLKoutA_TYPE pins.
8, 9	CLKoutA2, CLKoutA2*	O	Differential clock output A2. Output type set by CLKoutA_TYPE pins.
10, 36	CLKoutA_TYPE0, CLKoutA_TYPE1	I	Bank A output buffer type selection pins ⁽³⁾
11, 32	V _{cc}	PWR	Power supply for Core and Input buffer blocks. The V _{cc} supply operates from 3.3 V. Bypass with a 0.1 uF low-ESR capacitor placed very close to each V _{cc} pin.
12	OSCI _n	I	Input for crystal. Can also be driven by a XO, TCXO, or other external single-ended clock.
13	OSCO _{ut}	O	Output for crystal. Leave OSC _{out} floating if OSC _{in} is driven by a single-ended clock.
14, 17	CLKin_SEL0, CLKin_SEL1	I	Clock input selection pins ⁽³⁾
15, 16	CLKin0, CLKin0*	I	Universal clock input 0 (differential/single-ended)
18, 29	CLKoutB_TYPE0, CLKoutB_TYPE1	I	Bank B output buffer type selection pins ⁽³⁾
20, 21	CLKoutB2*, CLKoutB2	O	Differential clock output B2. Output type set by CLKoutB_TYPE pins.
22, 23	CLKoutB1*, CLKoutB1	O	Differential clock output B1. Output type set by CLKoutB_TYPE pins.
24, 27	V _{CCOB}	PWR	Power supply for Bank B Output buffers. V _{CCOB} can operate from 3.3 V or 2.5 V. The V _{CCOB} pins are internally tied together. Bypass with a 0.1 uF low-ESR capacitor placed very close to each V _{cco} pin. ⁽²⁾
25, 26	CLKoutB0*, CLKoutB0	O	Differential clock output B0. Output type set by CLKoutB_TYPE pins.
30, 31	CLKin1*, CLKin1	I	Universal clock input 1 (differential/single-ended)
33	REFout	O	LVC _{MOS} reference output. Enable output by pulling REFout_EN pin high.
34	V _{CCOC}	PWR	Power supply for REFout Output buffer. V _{CCOC} can operate from 3.3 V or 2.5 V. Bypass with a 0.1 uF low-ESR capacitor placed very close to each V _{cco} pin. ⁽²⁾
35	REFout_EN	I	REFout enable input. Enable signal is internally synchronized to selected clock input. ⁽³⁾

- (1) Any unused output pins should be left floating with minimum copper length (see note in [Clock Outputs](#)), or properly terminated if connected to a transmission line, or disabled/Hi-Z if possible. See [Clock Outputs](#) for output configuration or [Termination and Use of Clock Drivers](#) for output interface and termination techniques.
- (2) The output supply voltages or pins (V_{CCOA}, V_{CCOB}, and V_{CCOC}) will be called V_{CCO} in general when no distinction is needed, or when the output supply can be inferred from the output bank/type.
- (3) CMOS control input with internal pull-down resistor.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾⁽²⁾

		MIN	MAX	UNIT
V _{CC} , V _{CCO}	Supply Voltages	-0.3	3.6	V
V _{IN}	Input Voltage	-0.3	(V _{CC} + 0.3)	V
T _{STG}	Storage Temperature	-65	+150	°C
T _L	Lead Temperature (solder 4 s)		+260	°C
T _J	Junction Temperature		+150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/Distributors for availability and specifications.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Machine model (MM)	±150
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions. Pins listed as ±2000 V may actually have higher performance.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions. Pins listed as ±750 V may actually have higher performance.

6.3 Recommended Operating Conditions

PARAMETER		MIN	TYP	MAX	UNIT
T _A	Ambient Temperature Range	-40	25	85	°C
T _J	Junction Temperature			125	°C
V _{CC}	Core Supply Voltage Range	3.15	3.3	3.45	V
V _{CCO}	Output Supply Voltage Range ⁽¹⁾⁽²⁾	3.3 – 5% 2.5 – 5%	3.3 2.5	3.3 + 5% 2.5 + 5%	V

- (1) The output supply voltages or pins (V_{CCOA}, V_{CCOB}, and V_{CCOC}) will be called V_{CCO} in general when no distinction is needed, or when the output supply can be inferred from the output bank/type.
- (2) V_{CCO} should be less than or equal to V_{CC} (V_{CCO} ≤ V_{CC}).

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾⁽²⁾		NJK0036A (WQFN)	UNIT
		36 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	31.8	°C/W
R _{θJC(top)} (DAP)	Junction-to-case (top) thermal resistance	7.2	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) Specification assumes 9 thermal vias connect the die attach pad (DAP) to the embedded copper plane on the 4-layer JEDEC board. These vias play a key role in improving the thermal performance of the package. It is recommended that the maximum number of vias be used in the board layout.

6.5 Electrical Characteristics

Unless otherwise specified: $V_{CC} = 3.3\text{ V} \pm 5\%$, $V_{CCO} = 3.3\text{ V} \pm 5\%$, $2.5\text{ V} \pm 5\%$, $-40\text{ }^\circ\text{C} \leq T_A \leq 85\text{ }^\circ\text{C}$, CLKin driven differentially, input slew rate $\geq 3\text{ V/ns}$. Typical values represent most likely parametric norms at $V_{CC} = 3.3\text{ V}$, $V_{CCO} = 3.3\text{ V}$, $T_A = 25\text{ }^\circ\text{C}$, and at the Recommended Operation Conditions at the time of product characterization and are not ensured. ⁽¹⁾⁽²⁾

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
CURRENT CONSUMPTION⁽³⁾							
I_{CC_CORE}	Core Supply Current, All Outputs Disabled	CLKinX selected			8.5	10.5	mA
		OSCin selected			10	13.5	mA
I_{CC_PECL}	Additive Core Supply Current, Per LVPECL Bank Enabled				20	26.5	mA
I_{CC_LVDS}	Additive Core Supply Current, Per LVDS Bank Enabled				24	29.5	mA
I_{CC_HCSL}	Additive Core Supply Current, Per HCSL Bank Enabled				29	35	mA
I_{CC_CMOS}	Additive Core Supply Current, LVCMOS Output Enabled				3.5	5.5	mA
I_{CCO_PECL}	Additive Output Supply Current, Per LVPECL Bank Enabled	Includes Output Bank Bias and Load Currents, $R_T = 50\ \Omega$ to $V_{CCO} - 2\text{V}$ on all outputs in bank			100	123	mA
I_{CCO_LVDS}	Additive Output Supply Current, Per LVDS Bank Enabled				20	27.5	mA
I_{CCO_HCSL}	Additive Output Supply Current, Per HCSL Bank Enabled	Includes Output Bank Bias and Load Currents, $R_T = 50\ \Omega$ on all outputs in bank			50	65	mA
I_{CCO_CMOS}	Additive Output Supply Current, LVCMOS Output Enabled	200 MHz, $C_L = 5\text{ pF}$	$V_{CCO} = 3.3\text{ V} \pm 5\%$		9	10	mA
			$V_{CCO} = 2.5\text{ V} \pm 5\%$		7	8	mA
POWER SUPPLY RIPPLE REJECTION (PSRR)							
$PSRR_{PECL}$	Ripple-Induced Phase Spur Level Differential LVPECL Output ⁽⁴⁾	100 kHz, 100 mVpp Ripple Injected on V_{CCO} , $V_{CCO} = 2.5\text{ V}$	156.25 MHz		-65		dBc
			312.5 MHz		-63		
$PSRR_{LVDS}$	Ripple-Induced Phase Spur Level Differential LVDS Output ⁽⁴⁾		156.25 MHz		-76		dBc
			312.5 MHz		-74		
$PSRR_{HCSL}$	Ripple-Induced Phase Spur Level Differential HCSL Output ⁽⁴⁾		156.25 MHz		-72		dBc
			312.5 MHz		-63		
CMOS CONTROL INPUTS (CLKin_SELn, CLKoutX_TYPEn, REFOut_EN)							
V_{IH}	High-Level Input Voltage			1.6		V_{CC}	V
V_{IL}	Low-Level Input Voltage			GND		0.4	V
I_{IH}	High-Level Input Current	$V_{IH} = V_{CC}$, Internal pull-down resistor				50	μA
I_{IL}	Low-Level Input Current	$V_{IL} = 0\text{ V}$, Internal pull-down resistor		-5	0.1		μA

(1) The output supply voltages or pins (V_{CCOA} , V_{CCOB} , and V_{CCOC}) will be called V_{CCO} in general when no distinction is needed, or when the output supply can be inferred from the output bank/type.

(2) The Electrical Characteristics tables list ensured specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not ensured.

(3) See [Power Supply Recommendations](#) for more information on current consumption and power dissipation calculations.

(4) Power supply ripple rejection, or PSRR, is defined as the single-sideband phase spur level (in dBc) modulated onto the clock output when a single-tone sinusoidal signal (ripple) is injected onto the V_{CCO} supply. Assuming no amplitude modulation effects and small index modulation, the peak-to-peak deterministic jitter (DJ) can be calculated using the measured single-sideband phase spur level (PSRR) as follows: $DJ\text{ (ps pk-pk)} = [(2 * 10^{(PSRR / 20)}) / (\pi * f_{CLK})] * 1\text{E}12$

Electrical Characteristics (continued)

Unless otherwise specified: $V_{CC} = 3.3 \text{ V} \pm 5\%$, $V_{CC0} = 3.3 \text{ V} \pm 5\%$, $2.5 \text{ V} \pm 5\%$, $-40 \text{ }^\circ\text{C} \leq T_A \leq 85 \text{ }^\circ\text{C}$, CLKin driven differentially, input slew rate $\geq 3 \text{ V/ns}$. Typical values represent most likely parametric norms at $V_{CC} = 3.3 \text{ V}$, $V_{CC0} = 3.3 \text{ V}$, $T_A = 25 \text{ }^\circ\text{C}$, and at the Recommended Operation Conditions at the time of product characterization and are not ensured. ⁽¹⁾⁽²⁾

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
CLOCK INPUTS (CLKin0/CLKin0*, CLKin1/CLKin1*)							
f_{CLKin}	Input Frequency Range ⁽⁵⁾	Functional up to 3.1 GHz Output frequency range and timing specified per output type (refer to LVPECL, LVDS, HCSL, LVCMOS output specifications)	DC		3.1	GHz	
V_{IHD}	Differential Input High Voltage	CLKin driven differentially			V_{CC}	V	
V_{ILD}	Differential Input Low Voltage				GND	V	
V_{ID}	Differential Input Voltage Swing ⁽⁶⁾		0.15		1.3	V	
V_{CMD}	Differential Input Common Mode Voltage	$V_{\text{ID}} = 150 \text{ mV}$	0.25		$V_{CC} - 1.2$	V	
		$V_{\text{ID}} = 350 \text{ mV}$	0.25		$V_{CC} - 1.1$		
		$V_{\text{ID}} = 800 \text{ mV}$	0.25		$V_{CC} - 0.9$		
V_{IH}	Single-Ended Input High Voltage	CLKinX driven single-ended (AC or DC coupled), CLKinX* AC coupled to GND or externally biased within V_{CM} range			V_{CC}	V	
V_{IL}	Single-Ended Input Low Voltage				GND	V	
$V_{\text{I,SE}}$	Single-Ended Input Voltage Swing ⁽⁷⁾⁽⁸⁾		0.3		2	Vpp	
V_{CM}	Single-Ended Input Common Mode Voltage		0.25		$V_{CC} - 1.2$	V	
ISO_{MUX}	Mux Isolation, CLKin0 to CLKin1	$f_{\text{OFFSET}} > 50 \text{ kHz}$, $P_{\text{CLKinX}} = 0 \text{ dBm}$	$f_{\text{CLKin0}} = 100 \text{ MHz}$			-84	dBc
			$f_{\text{CLKin0}} = 200 \text{ MHz}$			-82	
			$f_{\text{CLKin0}} = 500 \text{ MHz}$			-71	
			$f_{\text{CLKin0}} = 1000 \text{ MHz}$			-65	
CRYSTAL INTERFACE (OSCin, OSCout)							
F_{CLK}	External Clock Frequency Range ⁽⁵⁾	OSCin driven single-ended, OSCout floating			250	MHz	
F_{XTAL}	Crystal Frequency Range	Fundamental mode crystal $\text{ESR} \leq 200 \text{ } \Omega$ (10 to 30 MHz) $\text{ESR} \leq 125 \text{ } \Omega$ (30 to 40 MHz) ⁽⁹⁾	10		40	MHz	
C_{IN}	OSCin Input Capacitance			4		pF	

(5) Specification is ensured by characterization and is not tested in production.

(6) See [Differential Voltage Measurement Terminology](#) for definition of V_{ID} and V_{OD} voltages.

(7) Parameter is specified by design, not tested in production.

(8) For clock input frequency $\geq 100 \text{ MHz}$, CLKinX can be driven with single-ended (LVCMOS) input swing up to 3.3 Vpp . For clock input frequency $< 100 \text{ MHz}$, the single-ended input swing should be limited to 2 Vpp max to prevent input saturation (refer to [Driving the Clock Inputs](#) for interfacing $2.5 \text{ V}/3.3 \text{ V}$ LVCMOS clock input $< 100 \text{ MHz}$ to CLKinX).

(9) The ESR requirements stated must be met to ensure that the oscillator circuitry has no startup issues. However, lower ESR values for the crystal may be necessary to stay below the maximum power dissipation (drive level) specification of the crystal. Refer to [Crystal Interface](#) for crystal drive level considerations.

Electrical Characteristics (continued)

Unless otherwise specified: $V_{CC} = 3.3\text{ V} \pm 5\%$, $V_{CCO} = 3.3\text{ V} \pm 5\%$, $2.5\text{ V} \pm 5\%$, $-40\text{ }^\circ\text{C} \leq T_A \leq 85\text{ }^\circ\text{C}$, CLKin driven differentially, input slew rate $\geq 3\text{ V/ns}$. Typical values represent most likely parametric norms at $V_{CC} = 3.3\text{ V}$, $V_{CCO} = 3.3\text{ V}$, $T_A = 25\text{ }^\circ\text{C}$, and at the Recommended Operation Conditions at the time of product characterization and are not ensured. ⁽¹⁾⁽²⁾

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
LVPECL OUTPUTS (CLKoutAn/CLKoutAn*, CLKoutBn/CLKoutBn*)							
$f_{\text{CLKout_FS}}$	Maximum Output Frequency Full V_{OD} Swing ⁽⁵⁾⁽¹⁰⁾	$V_{\text{OD}} \geq 600\text{ mV}$, $R_L = 100\text{ }\Omega$ differential	$V_{\text{CCO}} = 3.3\text{ V} \pm 5\%$, $R_T = 160\text{ }\Omega$ to GND	1.0	1.2		GHz

			CLKin: 625 MHz, Slew rate $\geq 3\text{ V/ns}$		30		
Jitter _{ADD}	Additive RMS Jitter with LVPECL clock source from LMK03806 ⁽¹¹⁾⁽¹³⁾	$V_{\text{CCO}} = 3.3\text{ V}$, $R_T = 160\text{ }\Omega$ to GND, $R_L = 100\text{ }\Omega$ differential	CLKin: 156.25 MHz, $J_{\text{SOURCE}} = 190\text{ fs RMS}$ (10 kHz to 1 MHz)		20		fs
			CLKin: 156.25 MHz, $J_{\text{SOURCE}} = 195\text{ fs RMS}$ (12 kHz to 20 MHz)		51		
Noise Floor	Noise Floor $f_{\text{OFFSET}} \geq 10\text{ MHz}$ ⁽¹⁴⁾⁽¹⁵⁾	$V_{\text{CCO}} = 3.3\text{ V}$, $R_T = 160\text{ }\Omega$ to GND, $R_L = 100\text{ }\Omega$ differential	CLKin: 100 MHz, Slew rate $\geq 3\text{ V/ns}$		-162.5		dBc/Hz
			CLKin: 156.25 MHz, Slew rate $\geq 2.7\text{ V/ns}$		-158.1		
			CLKin: 625 MHz, Slew rate $\geq 3\text{ V/ns}$		-154.4		
DUTY	Duty Cycle ⁽⁵⁾	50% input clock duty cycle		45%		55%	
V_{OH}	Output High Voltage	$T_A = 25\text{ }^\circ\text{C}$, DC Measurement, $R_T = 50\text{ }\Omega$ to $V_{\text{CCO}} - 2\text{ V}$		$V_{\text{CCO}} - 1.2$	$V_{\text{CCO}} - 0.9$	$V_{\text{CCO}} - 0.7$	V
V_{OL}	Output Low Voltage			$V_{\text{CCO}} - 2.0$	$V_{\text{CCO}} - 1.75$	$V_{\text{CCO}} - 1.5$	V
V_{OD}	Output Voltage Swing ⁽⁶⁾			600	830	1000	mV

(10) See [Typical Characteristics](#) for output operation over frequency.

(11) For the 100 MHz and 156.25 MHz clock input conditions, Additive RMS Jitter (J_{ADD}) is calculated using Method #1: $J_{\text{ADD}} = \text{SQRT}(J_{\text{OUT}}^2 - J_{\text{SOURCE}}^2)$, where J_{OUT} is the total RMS jitter measured at the output driver and J_{SOURCE} is the RMS jitter of the clock source applied to CLKin. For the 625 MHz clock input condition, Additive RMS Jitter is approximated using Method #2: $J_{\text{ADD}} = \text{SQRT}(2 * 10^{\text{dBc}/10} / (2 * \pi * f_{\text{CLK}}))$, where dBc is the phase noise power of the Output Noise Floor integrated from 1 to 20 MHz bandwidth. The phase noise power can be calculated as: dBc = Noise Floor + $10 * \log_{10}(20\text{ MHz} - 1\text{ MHz})$. The additive RMS jitter was approximated for 625 MHz using Method #2 because the RMS jitter of the clock source was not sufficiently low enough to allow practical use of Method #1. Refer to the "Noise Floor vs. CLKin Slew Rate" and "RMS Jitter vs. CLKin Slew Rate" plots in [Typical Characteristics](#).

(12) 100 MHz and 156.25 MHz input source from Rohde & Schwarz SMA100A Low-Noise Signal Generator and Sine-to-Square-wave Conversion block.

(13) 156.25 MHz LVPECL clock source from LMK03806 with 20 MHz crystal reference (crystal part number: ECS-200-20-30BU-DU). $J_{\text{SOURCE}} = 190\text{ fs RMS}$ (10 kHz to 1 MHz) and 195 fs RMS (12 kHz to 20 MHz). Refer to the LMK03806 datasheet for more information.

(14) The noise floor of the output buffer is measured as the far-out phase noise of the buffer. Typically this offset is $\geq 10\text{ MHz}$, but for lower frequencies this measurement offset can be as low as 5 MHz due to measurement equipment limitations.

(15) Phase noise floor will degrade as the clock input slew rate is reduced. Compared to a single-ended clock, a differential clock input (LVPECL, LVDS) will be less susceptible to degradation in noise floor at lower slew rates due to its common mode noise rejection. However, it is recommended to use the highest possible input slew rate for differential clocks to achieve optimal noise floor performance at the device outputs.

Electrical Characteristics (continued)

Unless otherwise specified: $V_{CC} = 3.3\text{ V} \pm 5\%$, $V_{CC0} = 3.3\text{ V} \pm 5\%$, $2.5\text{ V} \pm 5\%$, $-40\text{ }^\circ\text{C} \leq T_A \leq 85\text{ }^\circ\text{C}$, CLKin driven differentially, input slew rate $\geq 3\text{ V/ns}$. Typical values represent most likely parametric norms at $V_{CC} = 3.3\text{ V}$, $V_{CC0} = 3.3\text{ V}$, $T_A = 25\text{ }^\circ\text{C}$, and at the Recommended Operation Conditions at the time of product characterization and are not ensured. ⁽¹⁾⁽²⁾

NOTE	
(1)	The typical RMS jitter values in the plots show the total output RMS jitter (J _{OUT}) for each output buffer type and the source clock RMS jitter (J _{SOURCE}). From these values, the Additive RMS Jitter can be calculated as: J _{ADD} = SQRT(J _{OUT} ² - J _{SOURCE} ²).
(2)	20 MHz crystal characteristics: Abracon ABL series, AT cut, C _L = 18 pF, C ₀ = 4.4 pF measured (7 pF max), ESR = 8.5 Ω measured (40 Ω max), and Drive Level = 1 mW max (100 µW typical).
(3)	40 MHz crystal characteristics: Abracon ABLS2 series, AT cut, C _L = 18 pF, C ₀ = 5 pF measured (7 pF max), ESR = 5 Ω measured (40 Ω max), and Drive Level = 1 mW max (100 µW typical).

7 Parameter Measurement Information

7.1 Differential Voltage Measurement Terminology

The differential voltage of a differential signal can be described by two different definitions causing confusion when reading datasheets or communicating with other engineers. This section will address the measurement and description of a differential signal so that the reader will be able to understand and discern between the two different definitions when used.

The first definition used to describe a differential signal is the absolute value of the voltage potential between the inverting and non-inverting signal. The symbol for this first measurement is typically V_{ID} or V_{OD} depending on if an input or output voltage is being described.

The second definition used to describe a differential signal is to measure the potential of the non-inverting signal with respect to the inverting signal. The symbol for this second measurement is V_{SS} and is a calculated parameter. Nowhere in the IC does this signal exist with respect to ground, it only exists in reference to its differential pair. V_{SS} can be measured directly by oscilloscopes with floating references, otherwise this value can be calculated as twice the value of V_{OD} as described in the first description.

Figure 23 illustrates the two different definitions side-by-side for inputs and Figure 24 illustrates the two different definitions side-by-side for outputs. The V_{ID} (or V_{OD}) definition show the DC levels, V_{IH} and V_{OL} (or V_{OH} and V_{OL}), that the non-inverting and inverting signals toggle between with respect to ground. V_{SS} input and output definitions show that if the inverting signal is considered the voltage potential reference, the non-inverting signal voltage potential is now increasing and decreasing above and below the non-inverting reference. Thus the peak-to-peak voltage of the differential signal can be measured.

V_{ID} and V_{OD} are often defined as volts (V) and V_{SS} is often defined as volts peak-to-peak (V_{PP}).

8 Detailed Description

8.1 Overview

The LMK00306 is a 6-output differential clock fanout buffer with low additive jitter that can operate up to 3.1 GHz. It features a 3:1 input multiplexer with an optional crystal oscillator input, two banks of 3 differential outputs with multi-mode buffers (LVPECL, LVDS, HCSL, or Hi-Z), one LVCMOS output, and 3 independent output buffer supplies. The input selection and output buffer modes are controlled via pin strapping. The device is offered in a 36-pin WQFN package and leverages much of the high-speed, low-noise circuit design employed in the LMK04800 family of clock conditioners.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 V_{CC} and V_{CCO} Power Supplies

The LMK00306 has separate 3.3 V core supply (V_{CC}) and 3 independent 3.3 V/2.5 V output power supplies (V_{CCOA} , V_{CCOB} , V_{CCOC}). Output supply operation at 2.5 V enables lower power consumption and output-level compatibility with 2.5 V receiver devices. The output levels for LVPECL (V_{OH} , V_{OL}) and LVCMOS (V_{OH}) are referenced to the respective V_{CCO} supply, while the output levels for LVDS and HCSL are relatively constant over the specified V_{CCO} range. Refer to [Power Supply Recommendations](#) for additional supply related considerations, such as power dissipation, power supply bypassing, and power supply ripple rejection (PSRR).

NOTE

Care should be taken to ensure the V_{CCO} voltages do not exceed the V_{CC} voltage to prevent turning-on the internal ESD protection circuitry.

8.3.2 Clock Inputs

The input clock can be selected from CLKin0/CLKin0*, CLKin1/CLKin1*, or OSCin. Clock input selection is controlled using the CLKin_SEL[1:0] inputs as shown in [Table 2](#). Refer to [Driving the Clock Inputs](#) for clock input requirements. When CLKin0 or CLKin1 is selected, the crystal circuit is powered down. When OSCin is selected, the crystal oscillator circuit will start-up and its clock will be distributed to all outputs. Refer to [Crystal Interface](#) for more information. Alternatively, OSCin may be driven by a single-ended clock (up to 250 MHz) instead of a crystal.

Table 2. Input Selection

CLKin_SEL1	CLKin_SEL0	SELECTED INPUT
0	0	CLKin0, CLKin0*
0	1	CLKin1, CLKin1*
1	X	OSCin

[Table 3](#) shows the output logic state vs. input state when either CLKin0/CLKin0* or CLKin1/CLKin1* is selected. When OSCin is selected, the output state will be an inverted copy of the OSCin input state.

Table 3. CLKin Input vs. Output States

STATE of SELECTED CLKin	STATE of ENABLED OUTPUTS
CLKinX and CLKinX* inputs floating	Logic low
CLKinX and CLKinX* inputs shorted together	Logic low
CLKin logic low	Logic low
CLKin logic high	Logic high

8.3.3 Clock Outputs

The differential output buffer type for Bank A and Bank B outputs can be separately configured using the CLKoutA_TYPE[1:0] and CLKoutB_TYPE[1:0] inputs, respectively, as shown in [Table 4](#). For applications where all differential outputs are not needed, any unused output pin should be left floating with a minimum copper length (see note below) to minimize capacitance and potential coupling and reduce power consumption. If an entire output bank will not be used, it is recommended to disable/Hi-Z the bank to reduce power. Refer to [Termination and Use of Clock Drivers](#) for more information on output interface and termination techniques.

NOTE

For best soldering practices, the minimum trace length for any unused output pin should extend to include the pin solder mask. This way during reflow, the solder has the same copper area as connected pins. This allows for good, uniform fillet solder joints helping to keep the IC level during reflow.

Table 4. Differential Output Buffer Type Selection

CLKoutX_TYPE1	CLKoutX_TYPE0	CLKoutX BUFFER TYPE (BANK A or B)
0	0	LVPECL
0	1	LVDS
1	0	HCSL
1	1	Disabled (Hi-Z)

8.3.3.1 Reference Output

The reference output (REFout) provides a LVCMOS copy of the selected input clock. The LVCMOS output high level is referenced to the Vcco voltage. REFout can be enabled or disabled using the enable input pin, REFout_EN, as shown in [Table 5](#).

Table 5. Reference Output Enable

REFout_EN	REFout State
0	Disabled (Hi-Z)
1	Enabled

The REFout_EN input is internally synchronized with the selected input clock by the SYNC block. This synchronizing function prevents glitches and runt pulses from occurring on the REFout clock when enabled or disabled. REFout will be enabled within 3 cycles (t_{EN}) of the input clock after REFout_EN is toggled high. REFout will be disabled within 3 cycles (t_{DIS}) of the input clock after REFout_EN is toggled low.

When REFout is disabled, the use of a resistive loading can be used to set the output to a predetermined level. For example, if REFout is configured with a 1 k Ω load to ground, then the output will be pulled to low when disabled.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Driving the Clock Inputs

The LMK00306 has two universal inputs (CLKin0/CLKin0* and CLKin1/CLKin1*) that can accept AC- or DC-coupled 3.3V/2.5V LVPECL, LVDS, CML, SSTL, and other differential and single-ended signals that meet the input requirements specified in [Electrical Characteristics](#). The device can accept a wide range of signals due to its wide input common mode voltage range (V_{CM}) and input voltage swing (V_{ID}) / dynamic range. For 50% duty cycle and DC-balanced signals, AC coupling may also be employed to shift the input signal to within the V_{CM} range. Refer to [Termination and Use of Clock Drivers](#) for signal interfacing and termination techniques.

To achieve the best possible phase noise and jitter performance, it is mandatory for the input to have high slew rate of 3 V/ns (differential) or higher. Driving the input with a lower slew rate will degrade the noise floor and jitter. For this reason, a differential signal input is recommended over single-ended because it typically provides higher slew rate and common-mode-rejection. Refer to the “Noise Floor vs. CLKin Slew Rate” and “RMS Jitter vs. CLKin Slew Rate” plots in [Typical Characteristics](#).

While it is recommended to drive the CLKin/CLKin* pair with a differential signal input, it is possible to drive it with a single-ended clock provided it conforms to the Single-Ended Input specifications for CLKin pins listed in the [Electrical Characteristics](#). For large single-ended input signals, such as 3.3V or 2.5V LVCMOS, a 50 Ω load resistor should be placed near the input for signal attenuation to prevent input overdrive as well as for line termination to minimize reflections. Again, the single-ended input slew rate should be as high as possible to minimize performance degradation. The CLKin input has an internal bias voltage of about 1.4 V, so the input can be AC coupled as shown in [Figure 25](#). The output impedance of the LVCMOS driver plus R_S should be close to 50 Ω to match the characteristic impedance of the transmission line and load termination.

Figure 25. Single-Ended LVCMOS Input, AC Coupling

A single-ended clock may also be DC coupled to CLKinX as shown in [Figure 26](#). A 50- Ω load resistor should be placed near the CLKinX input for signal attenuation and line termination. Because half of the single-ended swing of the driver ($V_{O,PP} / 2$) drives CLKinX, CLKinX* should be externally biased to the midpoint voltage of the attenuated input swing ($(V_{O,PP} / 2) \times 0.5$). The external bias voltage should be within the specified input common mode voltage (V_{CM}) range. This can be achieved using external biasing resistors in the k Ω range (R_{B1} and R_{B2}) or another low-noise voltage reference. This will ensure the input swing crosses the threshold voltage at a point where the input slew rate is the highest.

If the LVCMOS driver cannot achieve sufficient swing with a DC-terminated 50 Ω load at the CLKinX input as shown in [Figure 26](#), then consider connecting the 50 Ω load termination to ground through a capacitor (C_{AC}). This AC termination blocks the DC load current on the driver, so the voltage swing at the input is determined by the voltage divider formed by the source ($R_o + R_S$) and 50 Ω load resistors. The value for C_{AC} depends on the trace delay, T_d , of the 50 Ω transmission line, where $C_{AC} \geq 3 \cdot T_d / 50\Omega$.

Driving the Clock Inputs (continued)

Figure 26. Single-Ended LVCMOS Input, DC Coupling with Common Mode Biasing

If the crystal oscillator circuit is not used, it is possible to drive the OSCin input with a single-ended external clock as shown in Figure 27. The input clock should be AC coupled to the OSCin pin, which has an internally-generated input bias voltage, and the OSCout pin should be left floating. While OSCin provides an alternative input to multiplex an external clock, it is recommended to use either universal input (CLKinX) since it offers higher operating frequency, better common mode and power supply noise rejection, and greater performance over supply voltage and temperature variations.

Figure 27. Driving OSCin with a Single-Ended Input

9.2 Crystal Interface

The LMK00306 has an integrated crystal oscillator circuit that supports a fundamental mode, AT-cut crystal. The crystal interface is shown in Figure 28.

Figure 28. Crystal Interface

The load capacitance (C_L) is specific to the crystal, but usually on the order of 18 - 20 pF. While C_L is specified for the crystal, the OSCin input capacitance ($C_{IN} = 4$ pF typical) of the device and PCB stray capacitance ($C_{STRAY} \sim 1\text{--}3$ pF) can affect the discrete load capacitor values, C_1 and C_2 .

For the parallel resonant circuit, the discrete capacitor values can be calculated as follows:

$$C_L = (C_1 * C_2) / (C_1 + C_2) + C_{IN} + C_{STRAY} \quad (1)$$

Typically, $C_1 = C_2$ for optimum symmetry, so Equation 1 can be rewritten in terms of C_1 only:

$$C_L = C_1^2 / (2 * C_1) + C_{IN} + C_{STRAY} \quad (2)$$

Finally, solve for C_1 :

$$C_1 = (C_L - C_{IN} - C_{STRAY}) * 2 \quad (3)$$

Crystal Interface (continued)

[Electrical Characteristics](#) provides crystal interface specifications with conditions that ensure start-up of the crystal, but it does not specify crystal power dissipation. The designer will need to ensure the crystal power dissipation does not exceed the maximum drive level specified by the crystal manufacturer. Overdriving the crystal can cause premature aging, frequency shift, and eventual failure. Drive level should be held at a sufficient level necessary to start-up and maintain steady-state operation.

The power dissipated in the crystal, P_{XTAL} , can be computed by:

$$P_{XTAL} = I_{RMS}^2 * R_{ESR} * (1 + C_0/C_L)^2$$

where

- I_{RMS} is the RMS current through the crystal.
 - R_{ESR} is the max. equivalent series resistance specified for the crystal
 - C_L is the load capacitance specified for the crystal
 - C_0 is the min. shunt capacitance specified for the crystal
- (4)

I_{RMS} can be measured using a current probe (e.g. Tektronix CT-6 or equivalent) placed on the leg of the crystal connected to OSCout with the oscillation circuit active.

As shown in [Figure 28](#), an external resistor, R_{LIM} , can be used to limit the crystal drive level, if necessary. If the power dissipated in the selected crystal is higher than the drive level specified for the crystal with R_{LIM} shorted, then a larger resistor value is mandatory to avoid overdriving the crystal. However, if the power dissipated in the crystal is less than the drive level with R_{LIM} shorted, then a zero value for R_{LIM} can be used. As a starting point, a suggested value for R_{LIM} is 1.5 k Ω .

9.3 Termination and Use of Clock Drivers

When terminating clock drivers keep in mind these guidelines for optimum phase noise and jitter performance:

- Transmission line theory should be followed for good impedance matching to prevent reflections.
- Clock drivers should be presented with the proper loads.
 - LVDS outputs are current drivers and require a closed current loop.
 - HCSL drivers are switched current outputs and require a DC path to ground via 50 Ω termination.
 - LVPECL outputs are open emitter and require a DC path to ground.
- Receivers should be presented with a signal biased to their specified DC bias level (common mode voltage) for proper operation. Some receivers have self-biasing inputs that automatically bias to the proper voltage level; in this case, the signal should normally be AC coupled.

It is possible to drive a non-LVPECL or non-LVDS receiver with a LVDS or LVPECL driver as long as the above guidelines are followed. Check the datasheet of the receiver or input being driven to determine the best termination and coupling method to be sure the receiver is biased at the optimum DC voltage (common mode voltage).

9.3.1 Termination for DC Coupled Differential Operation

For DC coupled operation of an LVDS driver, terminate with 100 Ω as close as possible to the LVDS receiver as shown in [Figure 29](#).

Figure 29. Differential LVDS Operation, DC Coupling, No Biasing by the Receiver

Termination and Use of Clock Drivers (continued)

For DC coupled operation of an HCSL driver, terminate with $50\ \Omega$ to ground near the driver output as shown in Figure 30. Series resistors, R_s , may be used to limit overshoot due to the fast transient current. Because HCSL drivers require a DC path to ground, AC coupling is not allowed between the output drivers and the $50\ \Omega$ termination resistors.

Figure 30. HCSL Operation, DC Coupling

For DC coupled operation of an LVPECL driver, terminate with $50\ \Omega$ to $V_{CC0} - 2\text{ V}$ as shown in Figure 31. Alternatively terminate with a Thevenin equivalent circuit as shown in Figure 32 for V_{CC0} (output driver supply voltage) = 3.3 V and 2.5 V. In the Thevenin equivalent circuit, the resistor dividers set the output termination voltage (V_{TT}) to $V_{CC0} - 2\text{ V}$.

Figure 31. Differential LVPECL Operation, DC Coupling

Figure 32. Differential LVPECL Operation, DC Coupling, Thevenin Equivalent

Termination and Use of Clock Drivers (continued)

9.3.2 Termination for AC Coupled Differential Operation

AC coupling allows for shifting the DC bias level (common mode voltage) when driving different receiver standards. Since AC coupling prevents the driver from providing a DC bias voltage at the receiver, it is important to ensure the receiver is biased to its ideal DC level.

When driving differential receivers with an LVDS driver, the signal may be AC coupled by adding DC blocking capacitors; however the proper DC bias point needs to be established at both the driver side and the receiver side. The recommended termination scheme depends on whether the differential receiver has integrated termination resistors or not.

When driving a differential receiver without internal 100 Ω differential termination, the AC coupling capacitors should be placed between the load termination resistor and the receiver to allow a DC path for proper biasing of the LVDS driver. This is shown in Figure 33. The load termination resistor and AC coupling capacitors should be placed as close as possible to the receiver inputs to minimize stub length. The receiver can be biased internally or externally to a reference voltage within the receiver’s common mode input range through resistors in the kilo-ohm range.

When driving a differential receiver with internal 100 Ω differential termination, a source termination resistor should be placed before the AC coupling capacitors for proper DC biasing of the driver as shown in Figure 34. However, with a 100-Ω resistor at the source and the load (i.e. double terminated), the equivalent resistance seen by the LVDS driver is 50 Ω which causes the effective signal swing at the input to be reduced by half. If a self-terminated receiver requires input swing greater than 250 mVpp (differential) as well as AC coupling to its inputs, then the LVDS driver with the double-terminated arrangement in Figure 34 may not meet the minimum input swing requirement; alternatively, the LVPECL or HCSL output driver format with AC coupling is recommended to meet the minimum input swing required by the self-terminated receiver.

When using AC coupling with LVDS outputs, there may be a startup delay observed in the clock output due to capacitor charging. The examples in Figure 33 and Figure 34 use 0.1 μF capacitors, but this value may be adjusted to meet the startup requirements for the particular application.

LVPECL drivers require a DC path to ground. When AC coupling an LVPECL signal use 160 Ω emitter resistors (or 91 Ω for V_{cco} = 2.5 V) close to the LVPECL driver to provide a DC path to ground as shown in Figure 38. For proper receiver operation, the signal should be biased to the DC bias level (common mode voltage) specified by the receiver. The typical DC bias voltage (common mode voltage) for LVPECL receivers is 2 V. Alternatively, a Thevenin equivalent circuit forms a valid termination as shown in Figure 35 for V_{cco} = 3.3 V and 2.5 V. Note: this Thevenin circuit is different from the DC coupled example in Figure 32, since the voltage divider is setting the input common mode voltage of the receiver.

Termination and Use of Clock Drivers (continued)

Figure 35. Differential LVPECL Operation, AC Coupling, Thevenin Equivalent

9.3.3 Termination for Single-Ended Operation

A balun can be used with either LVDS or LVPECL drivers to convert the balanced, differential signal into an unbalanced, single-ended signal.

It is possible to use an LVPECL driver as one or two separate 800 mV p-p signals. When DC coupling one of the LMK00306 LVPECL driver of a CLKoutX/CLKoutX* pair, be sure to properly terminate the unused driver. When DC coupling on of the LMK00306 LVPECL drivers, the termination should be 50 Ω to V_{CCO} - 2 V as shown in Figure 36. The Thevenin equivalent circuit is also a valid termination as shown in Figure 37 for V_{CCO} = 3.3 V.

Figure 36. Single-Ended LVPECL Operation, DC Coupling

Figure 37. Single-Ended LVPECL Operation, DC Coupling, Thevenin Equivalent

Termination and Use of Clock Drivers (continued)

When AC coupling an LVPECL driver use a $160\ \Omega$ emitter resistor (or $91\ \Omega$ for $V_{CC0} = 2.5\ \text{V}$) to provide a DC path to ground and ensure a $50\ \Omega$ termination with the proper DC bias level for the receiver. The typical DC bias voltage for LVPECL receivers is $2\ \text{V}$. If the companion driver is not used, it should be terminated with either a proper AC or DC termination. This latter example of AC coupling a single-ended LVPECL signal can be used to measure single-ended LVPECL performance using a spectrum analyzer or phase noise analyzer. When using most RF test equipment no DC bias point ($0\ \text{VDC}$) is required for safe and proper operation. The internal $50\ \Omega$ termination the test equipment correctly terminates the LVPECL driver being measured as shown in [Figure 38](#). When using only one LVPECL driver of a CLKoutX/CLKoutX* pair, be sure to properly terminated the unused driver.

Figure 38. Single-Ended LVPECL Operation, AC Coupling

10 Power Supply Recommendations

10.1 Power Supply Sequencing

When powering the V_{CC} and V_{CCO} pins from separate supply rails, it is recommended for the supplies to reach their regulation point at approximately the same time while ramping up, or reach ground potential at the same time while ramping down. Using simultaneous or ratiometric power supply sequencing prevents internal current flow from V_{CC} to V_{CCO} pins that could occur when V_{CC} is powered before V_{CCO}.

10.2 Current Consumption and Power Dissipation Calculations

The current consumption values specified in [Electrical Characteristics](#) can be used to calculate the total power dissipation and IC power dissipation for any device configuration. The total V_{CC} core supply current (I_{CC_TOTAL}) can be calculated using [Equation 5](#):

$$I_{CC_TOTAL} = I_{CC_CORE} + I_{CC_BANK_A} + I_{CC_BANK_B} + I_{CC_CMOS}$$

where

- I_{CC_CORE} is the current for core logic and input blocks and depends on selected input (CLKinX or OSCin).
- I_{CC_BANK_A} is the current for Bank A and depends on output type (I_{CC_PECL}, I_{CC_LVDS}, I_{CC_HCSL}, or 0 mA if disabled).
- I_{CC_BANK_B} is the current for Bank B and depends on output type (I_{CC_PECL}, I_{CC_LVDS}, I_{CC_HCSL}, or 0 mA if disabled).
- I_{CC_CMOS} is the current for the LVCMOS output (or 0 mA if REFout is disabled). (5)

Since the output supplies (V_{CCOA}, V_{CCOB}, V_{CCOC}) can be powered from 3 independent voltages, the respective output supply currents (I_{CCO_BANK_A}, I_{CCO_BANK_B}, and I_{CCO_CMOS}) should be calculated separately.

I_{CCO_BANK} for either Bank A or B can be directly taken from the corresponding output supply current spec (I_{CCO_PECL}, I_{CCO_LVDS}, or I_{CCO_HCSL}) **provided the output loading matches the specified conditions**. Otherwise, I_{CCO_BANK} should be calculated as follows:

$$I_{CCO_BANK} = I_{BANK_BIAS} + (N * I_{OUT_LOAD})$$

where

- I_{BANK_BIAS} is the output bank bias current (fixed value).
- I_{OUT_LOAD} is the DC load current per loaded output pair.
- N is the number of loaded output pairs per bank (N = 0 to 3). (6)

[Table 6](#) shows the typical I_{BANK_BIAS} values and I_{OUT_LOAD} expressions for LVPECL, LVDS, and HCSL.

For LVPECL, it is possible to use a larger termination resistor (R_T) to ground instead of terminating with 50 Ω to V_{TT} = V_{CCO} - 2 V; this technique is commonly used to eliminate the extra termination voltage supply (V_{TT}) and potentially reduce device power dissipation at the expense of lower output swing. For example, when V_{CCO} is 3.3 V, a R_T value of 160 Ω to ground will eliminate the 1.3 V termination supply without sacrificing much output swing. In this case, the typical I_{OUT_LOAD} is 25 mA, so I_{CCO_PECL} for a fully-loaded bank reduces to 95 mA (vs. 100 mA with 50 Ω resistors to V_{CCO} - 2 V).

Table 6. Typical Output Bank Bias and Load Currents

CURRENT PARAMETER	LVPECL	LVDS	HCSL
I _{BANK_BIAS}	20 mA	17.4 mA	3.6 mA
I _{OUT_LOAD}	(V _{OH} - V _{TT})/R _T + (V _{OL} - V _{TT})/R _T	0 mA (No DC load current)	V _{OH} /R _T

Once the current consumption is known for each supply, the total power dissipation (P_{TOTAL}) can be calculated as:

$$P_{TOTAL} = (V_{CC} * I_{CC_TOTAL}) + (V_{CCOA} * I_{CCO_BANK_A}) + (V_{CCOB} * I_{CCO_BANK_B}) + (V_{CCOC} * I_{CCO_CMOS}) \quad (7)$$

If the device is configured with LVPECL or HCSL outputs, then it is also necessary to calculate the power dissipated in any termination resistors (P_{RT_PECL} and P_{RT_HCSL}) and in any LVPECL termination voltages (P_{VTT_PECL}). The external power dissipation values can be calculated as follows:

$$P_{RT_PECL} \text{ (per LVPECL pair)} = (V_{OH} - V_{TT})^2/R_T + (V_{OL} - V_{TT})^2/R_T \quad (8)$$

$$P_{VTT_PECL} \text{ (per LVPECL pair)} = V_{TT} * [(V_{OH} - V_{TT})/R_T + (V_{OL} - V_{TT})/R_T] \quad (9)$$

$$P_{RT_HCSL} \text{ (per HCSL pair)} = V_{OH}^2 / R_T \quad (10)$$

Finally, the IC power dissipation (P_{DEVICE}) can be computed by subtracting the external power dissipation values from P_{TOTAL} as follows:

$$P_{DEVICE} = P_{TOTAL} - N_1 * (P_{RT_PECL} + P_{VTT_PECL}) - N_2 * P_{RT_HCSL}$$

where

- N_1 is the number of LVPECL output pairs with termination resistors to V_{TT} (usually $V_{CCO} - 2\text{ V}$ or GND).
- N_2 is the number of HCSL output pairs with termination resistors to GND. (11)

10.2.1 Power Dissipation Example: Worst-Case Dissipation

This example shows how to calculate IC power dissipation for a configuration to estimate **worst-case power dissipation**. In this case, the maximum supply voltage and supply current values specified in [Electrical Characteristics](#) are used.

- $V_{CC} = V_{CCO} = 3.465\text{ V}$. Max I_{CC} and I_{CCO} values.
- CLKin0/CLKin0* input is selected.
- Banks A and B are configured for LVPECL: all outputs terminated with $50\ \Omega$ to $V_T = V_{CCO} - 2\text{ V}$.
- REFout is enabled with 5 pF load.
- $T_A = 85\text{ }^\circ\text{C}$

Using the power calculations from the previous section and *maximum* supply current specifications, we can compute P_{TOTAL} and P_{DEVICE} .

- From [Equation 5](#): $I_{CC_TOTAL} = 10.5\text{ mA} + 22.5\text{ mA} + 22.5\text{ mA} + 5.5\text{ mA} = 61\text{ mA}$
- From I_{CCO_PECL} max spec: $I_{CCO_BANK_A} = I_{CCO_BANK_B} = 115\text{ mA}$
- From [Equation 7](#): $P_{TOTAL} = 3.465\text{ V} * (61\text{ mA} + 115\text{ mA} + 115\text{ mA} + 10\text{ mA}) = 1043\text{ mW}$
- From [Equation 8](#): $P_{RT_PECL} = ((2.57\text{ V} - 1.47\text{ V})^2/50\ \Omega) + ((1.72\text{ V} - 1.47\text{ V})^2/50\ \Omega) = 25.5\text{ mW}$ (per output pair)
- From [Equation 9](#): $P_{VTT_PECL} = 1.47\text{ V} * [((2.57\text{ V} - 1.47\text{ V}) / 50\ \Omega) + ((1.72\text{ V} - 1.47\text{ V}) / 50\ \Omega)] = 39.5\text{ mW}$ (per output pair)
- From [Equation 10](#): $P_{RT_HCSL} = 0\text{ mW}$ (no HCSL outputs)
- From [Equation 11](#): $P_{DEVICE} = 1043\text{ mW} - (6 * (25.5\text{ mW} + 39.5\text{ mW})) - 0\text{ mW} = 653\text{ mW}$

In this worst-case example, the IC device will dissipate about 653 mW or 63% of the total power (1043 mW), while the remaining 37% will be dissipated in the LVPECL emitter resistors (153 mW for 6 pairs) and termination voltage (237 mW into $V_{CCO} - 2\text{ V}$). Based on θ_{JA} of $31.8\text{ }^\circ\text{C/W}$, the estimated die junction temperature would be about $21\text{ }^\circ\text{C}$ above ambient, or $106\text{ }^\circ\text{C}$ when $T_A = 85\text{ }^\circ\text{C}$.

10.3 Power Supply Bypassing

The V_{CC} and V_{CCO} power supplies should have a high-frequency bypass capacitor, such as $0.1\text{ }\mu\text{F}$ or $0.01\text{ }\mu\text{F}$, placed very close to each supply pin. $1\text{ }\mu\text{F}$ to $10\text{ }\mu\text{F}$ decoupling capacitors should also be placed nearby the device between the supply and ground planes. All bypass and decoupling capacitors should have short connections to the supply and ground plane through a short trace or via to minimize series inductance.

10.3.1 Power Supply Ripple Rejection

In practical system applications, power supply noise (ripple) can be generated from switching power supplies, digital ASICs or FPGAs, etc. While power supply bypassing will help filter out some of this noise, it is important to understand the effect of power supply ripple on the device performance. When a single-tone sinusoidal signal is applied to the power supply of a clock distribution device, such as LMK00306, it can produce narrow-band phase modulation as well as amplitude modulation on the clock output (carrier). In the single-side band phase noise spectrum, the ripple-induced phase modulation appears as a phase spur level relative to the carrier (measured in dBc).

Power Supply Bypassing (continued)

For the LMK00306, power supply ripple rejection, or PSRR, was measured as the single-sideband phase spur level (in dBc) modulated onto the clock output when a ripple signal was injected onto the V_{cco} supply. The PSRR test setup is shown in Figure 39.

Figure 39. PSRR Test Setup

A signal generator was used to inject a sinusoidal signal onto the V_{cco} supply of the DUT board, and the peak-to-peak ripple amplitude was measured at the V_{cco} pins of the device. A limiting amplifier was used to remove amplitude modulation on the differential output clock and convert it to a single-ended signal for the phase noise analyzer. The phase spur level measurements were taken for clock frequencies of 156.25 MHz and 312.5 MHz under the following power supply ripple conditions:

- Ripple amplitude: 100 mV_{pp} on V_{cco} = 2.5 V
- Ripple frequencies: 100 kHz, 1 MHz, and 10 MHz

Assuming no amplitude modulation effects and small index modulation, the peak-to-peak deterministic jitter (DJ) can be calculated using the measured single-sideband phase spur level (PSRR) as follows:

$$DJ \text{ (ps pk-pk)} = [(2 \cdot 10^{(PSRR / 20)}) / (\pi \cdot f_{CLK})] \cdot 10^{12} \quad (12)$$

The “PSRR vs. Ripple Frequency” plots in *Typical Characteristics* show the ripple-induced phase spur levels for the differential output types at 156.25 MHz and 312.5 MHz. The LMK00306 exhibits very good and well-behaved PSRR characteristics across the ripple frequency range for all differential output types. The phase spur levels for LVPECL are below -64 dBc at 156.25 MHz and below -62 dBc at 312.5 MHz. Using Equation 12, these phase spur levels translate to Deterministic Jitter values of 2.57 ps pk-pk at 156.25 MHz and 1.62 ps pk-pk at 312.5 MHz. Testing has shown that the PSRR performance of the device improves for V_{cco} = 3.3 V under the same ripple amplitude and frequency conditions.

10.4 Thermal Management

Power dissipation in the LMK00306 device can be high enough to require attention to thermal management. For reliability and performance reasons the die temperature should be limited to a maximum of 125 °C. That is, as an estimate, T_A (ambient temperature) plus device power dissipation times R_{θJA} should not exceed 125 °C.

The package of the device has an exposed pad that provides the primary heat removal path as well as excellent electrical grounding to the printed circuit board. To maximize the removal of heat from the package a thermal land pattern including multiple vias to a ground plane must be incorporated on the PCB within the footprint of the package. The exposed pad must be soldered down to ensure adequate heat conduction out of the package.

Thermal Management (continued)

A recommended land and via pattern is shown in [Figure 40](#). More information on soldering WQFN packages can be obtained at: <http://www.ti.com/packaging>.

Figure 40. Recommended Land and Via Pattern

To minimize junction temperature it is recommended that a simple heat sink be built into the PCB (if the ground plane layer is not exposed). This is done by including a copper area of about 2 square inches on the opposite side of the PCB from the device. This copper area may be plated or solder coated to prevent corrosion but should not have conformal coating (if possible), which could provide thermal insulation. The vias shown in [Figure 40](#) should connect these top and bottom copper layers and to the ground layer. These vias act as “heat pipes” to carry the thermal energy away from the device side of the board to where it can be more effectively dissipated.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMK00306SQ/NOPB	ACTIVE	WQFN	NJK	36	1000	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	K00306	Samples
LMK00306SQE/NOPB	ACTIVE	WQFN	NJK	36	250	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	K00306	Samples
LMK00306SQX/NOPB	ACTIVE	WQFN	NJK	36	2500	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 85	K00306	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内, 且 TI 认为有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定, 否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险, 客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予的直接或间接版权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息, 不能构成从 TI 获得使用这些产品或服务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可, 或是 TI 的专利权或其它知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分, 仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时, 如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分, 则会失去相关 TI 组件或服务的所有明示或暗示授权, 且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意, 尽管任何应用相关信息或支持仍可能由 TI 提供, 但他们将独自负责满足与其产品及其应用中使用 TI 产品相关的所有法律、法规和安全相关要求。客户声明并同意, 他们具备制定与实施安全措施所需的全部专业技术和知识, 可预见故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中, 为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此, 此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备) 的授权许可, 除非各方授权官员已经达成了专门管控此类使用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同意, 对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用, 其风险由客户单独承担, 并且由客户独自负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品, 这些产品主要用于汽车。在任何情况下, 因使用非指定产品而无法达到 ISO/TS16949 要求, TI 不承担任何责任。
