

# ONET1131EC 集成时钟和数据恢复 (CDR) 功能的外部调制激光器驱动器

## 1 特性

- 集成调制器驱动器，其最小输出幅值最高可达 2 V<sub>pp</sub>（单端），偏置电流最高可达 150mA（拉电流）。
- 支持外部调制激光器，包括电吸收调制器激光器 (EML) 和基于 Mach-Zahnder 调制器 (MZM) 的激光器。
- 集成 CDR 功能，支持 9.80Gbps 至 11.7Gbps 无参考运行
- 集成数模转换器 (DAC) 和模数转换器 (ADC) 的双线制数字接口，可实现控制和诊断管理
- 输出极性选择
- 用于调节 CDR 带宽的可编程抖动传输带宽
- CDR 旁路模式，支持以低数据速率运行
- 具有可选监视器光电二极管 (PD) 范围的自动功率控制 (APC) 回路
- 可编程发送输入均衡器
- 发送器交叉点调节和去加重功能
- 包括激光安全 特性
- 电源监视器和温度传感器
- 2.5V 单电源
- 工作温度范围：-40°C 至 100°C
- 表面贴装 4mm x 4mm 32 引脚四方扁平无引线 (QFN) 封装（间距为 0.4mm）

## 2 应用

- 10Gbps 无源光纤网络 (PON)、针对 FTTx 部署的光线路终端 (OLT) 收发器
- XFP 和 SFP+ 10Gbps 同步光纤网络 (SONET) OC-192 光学收发器
- XFP 和 SFP+ 10GBASE-ER/ZR 光学收发器
- 8x 和 10x 光纤通道光学收发器

## 3 说明

ONET1131EC 是一款 2.5V EML 调制器驱动器，支持发送时钟和数据恢复 (CDR) 功能，无需基准时钟即可在 9.8Gbps 至 11.7Gbps 范围内运行。该器件在 CDR 旁路模式下能够以较低数据速率运行，其双线制串行接口支持针对 多项功能（如输出极性选择和输入均衡）进行数字控制。

发送路径由 1 个可调节输入均衡器（可均衡长达 300mm

（12 英寸）FR4 印刷电路板微带或带状传输线）、1 个多速率 CDR 及 1 个输出调制器驱动器组成。该器件以交叉点调节和去加重的形式提供输出波形控制，从而增加光学眼图波罩裕度。该器件提供激光器偏置电流并集成自动功率控制 (APC) 回路，以补偿平均光学功率随电压、温度和时间的变化。

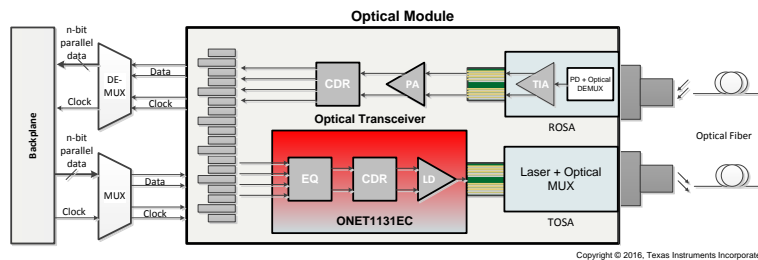

ONET1131EC 内置模数转换器和数模转换器，支持管理收发器，无需使用专用微控制器。

### 器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸（标称值）
ONET1131EC	VQFN (32)	4.00mm x 4.00mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

### 简化框图

## 5 Pin Configuration and Function

The ONET1131EC is packaged in a small footprint 4 mm x 4 mm 32 pin RoHS compliant QFN package with a lead pitch of 0.4 mm.

### Pin Functions

NUMBER	NAME	Type	DESCRIPTION
LOL	1	Digital-out	Loss of lock indicator. High level indicates the transmitter CDR is out of lock. Open drain output. Requires an external 4.7 k $\Omega$ to 10 k $\Omega$ pull-up resistor to VCC for proper operation. This pin is 3.3 V tolerant.
MONB	2	Analog-out	Bias current monitor.
GND	3, 6, 19, 22	Supply	Circuit ground.
DIN+	4	Analog-in	Non-inverted transmitter data input. On-chip differentially 100 $\Omega$ terminated to TXIN-. Must be AC coupled.
DIN-	5	Analog-in	Inverted transmitter data input. On-chip differentially 100 $\Omega$ terminated to TXIN+. Must be AC coupled.
PD	7	Analog	Photodiode input. Pin can source or sink current dependent on register setting.
MONP	8	Analog-out	Photodiode current monitor.
LF	9	Analog-in	Transmitter loop filter capacitor.
BIAS	10	Analog	Sinks or sources the bias current for the laser in both APC and open loop modes.
VCC	11, 14, 27, 30	Supply	2.5 V $\pm$ 5% supply.
OUT-	12	CML-out	Inverted transmitter data output. Internally terminated in single-ended operation mode.
OUT+	13	CML-out	Non-Inverted transmitter data output.
VDD	15	Supply	2.5 V $\pm$ 5% supply for the digital circuitry.
AMP	16	Analog-in	Output amplitude control. Output amplitude can be adjusted by applying a voltage of 0 to 2 V to this pin. Leave open when not used.

**Pin Functions (continued)**

NUMBER	NAME	Type	DESCRIPTION
SDA	17	Digital-in/out	2-wire interface serial data input. Requires an external 4.7-k $\Omega$ to 10-k $\Omega$ pull-up resistor to VCC. This pin is 3.3-V tolerant.
SCK	18	Digital-in	2-wire interface serial clock input. Requires an external 4.7-k $\Omega$ to 10-k $\Omega$ pull-up resistor to VCC. This pin is 3.3-V tolerant.
NC	20, 21, 24, 25, 26, 28, 29		Do not connect
COMP	23	Analog	Compensation pin used to control the bandwidth of the APC loop. Connect a 0.01- $\mu$ F capacitor to ground.
FLT	31	Digital-out	Transmitter fault detection flag. High level indicates that a fault has occurred. Open drain output. Requires an external 4.7 k $\Omega$ to 10 k $\Omega$ pull-up resistor to VCC for proper operation. This pin is 3.3-V tolerant.
DIS	32	Digital-in	Disables the bias current when set to high state. Includes a 250-k $\Omega$ pull-up resistor to VCC. Requires an external 4.7 k $\Omega$ to 10 k $\Omega$ pull-up resistor to VCC for proper operation. Toggle to reset a fault condition. This is an ORed function with the TXBIASEN bit (bit 2 in <a href="#">register 1</a> ). This pin is 3.3-V tolerant.

## 6 Specifications

### 6.1 Absolute Maximum Ratings <sup>(1)(2)</sup>

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Supply voltage	at VCC, VDD	-0.5	3	V
Voltage	at 3.3-V tolerant pins LOL, SDA, SCK, FLT, DIS	-0.5	3.6	V
	at all other pins MONB, DIN+, DIN-, PD, MONP, LF, BIAS, OUT-, OUT+, AMP, COMP	-0.5	3	V
Maximum current at transmitter input pins	DIN+, DIN-		10	mA
Maximum current at transmitter output pins	OUT+, OUT-		125	mA
Maximum junction temperature, T <sub>J</sub>			125	°C
Storage temperature, T <sub>stg</sub>		-65	150	°C

- (1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	TYP	MAX	UNIT	
V <sub>CC</sub>	Supply Voltage	2.37	2.5	2.63	V	
V <sub>IH</sub>	Digital input high voltage	2			V	
V <sub>IL</sub>	Digital input low voltage				V	
	Photodiode current range	Control bit TXPDRNG = 1x, step size = 3 μA	3080		μA	
		Control bit TXPDRNG = 01, step size = 1.5 μA	1540			
		Control bit TXPDRNG = 00, step size = 0.75 μA	770			
	Serial Data rate	TXCDDR_DIS = 0	9.8	11.7	Gbps	
		TXCDDR_DIS = 1	1	11.7		
V <sub>AMP</sub>	Amplitude control input voltage range	0		2	V	
t <sub>R(IN)</sub>	Input rise time	20%–80%		30	45	ps
t <sub>F(IN)</sub>	Input fall time	20%–80%		30	45	ps
T <sub>C</sub>	Temperature at thermal pad	-40		100		°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		RSM (VQFN)	UNIT
		32 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	37.2	°C/W
R <sub>θJctop</sub>	Junction-to-case (top) thermal resistance	30.1	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	7.8	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.4	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	7.6	°C/W
R <sub>θJcbot</sub>	Junction-to-case (bottom) thermal resistance	2.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 DC Electrical Characteristics

Over recommended operating conditions, open loop operation, V<sub>OUT</sub> = 2 V<sub>PP</sub> single-ended, I<sub>(BIAS)</sub> = 80 mA, unless otherwise noted. Typical operating condition is at V<sub>CC</sub> = 2.5 V and T<sub>A</sub> = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>CC</sub>	Supply voltage		2.37	2.5	2.63	V
I <sub>VCC</sub>	Supply current in single-ended TX mode with CDRs enabled	TXMODE = 1, TXCDR_DIS = 0, TX V <sub>OUT</sub> = 2 V <sub>PP</sub> single-ended, I <sub>(BIAS)</sub> = 0 mA		158	193	mA
	Power dissipation in single-ended TX mode with CDRs enabled			380	508	mW
	Supply current in differential TX mode with CDRs enabled	TXMODE = 0, TXCDR_DIS = 0, TX V <sub>OUT</sub> = 2 V <sub>PP</sub> single-ended, I <sub>(BIAS)</sub> = 0 mA		197	237	mA
	Power dissipation in differential TX mode with CDRs enabled			493	623	mW
	Supply current in single-ended TX mode with CDRs disabled	TXMODE = 1, TXCDR_DIS = 1, TX V <sub>OUT</sub> = 2 V <sub>PP</sub> single-ended, I <sub>(BIAS)</sub> = 0 mA		119	193	mA
	Power dissipation in single-ended TX mode with CDRs disabled			298	376	mW
	Supply current in differential TX mode with CDRs disabled	TXMODE = 0, TXCDR_DIS = 1, TX V <sub>OUT</sub> = 2 V <sub>PP</sub> single-ended, I <sub>(BIAS)</sub> = 0 mA;		164	200	mA
	Power dissipation in differential TX mode with CDRs disabled			410	526	mW
R <sub>(IN)</sub>	Data input resistance	Differential between DIN+ / DIN-		100		Ω
	Data input termination mismatch				5%	
R <sub>(OUT)</sub>	Output resistance	Single-ended at OUT+ or OUT-		60		Ω
	Digital input current	DIS pull up to V <sub>CC</sub>	-20		20	μA
V <sub>OH</sub>	Digital output high voltage	LOL, FLT pull-up to V <sub>CC</sub> , I <sub>SOURCE</sub> = 37.5 μA	2.1			V
V <sub>OL</sub>	Digital output low voltage	LOL, FLT pull-up to V <sub>CC</sub> , I <sub>SINK</sub> = 350 μA			0.4	V
I <sub>(BIAS-MIN)</sub>	Minimum bias current	See <sup>(1)</sup>			5	mA
I <sub>(BIAS-MAX)</sub>	Maximum bias current	Source. BIASPOL = 0, DAC set to maximum, open and closed loop	145	150		mA
		Sink. BIASPOL = 1, DAC set to maximum, open and closed loop	95	100		mA
I <sub>(BIAS-DIS)</sub>	Bias current during disable				100	μA
	Average power stability	APC loop enabled		±0.5		dB
	Bias pin compliance voltage	Source. TXBIASPOL = 0			V <sub>CC</sub> - 0.45	V
		Sink. TXBIASPOL = 1	0.45			V
	Temperature sensor accuracy	With 1-point external mid-scale calibration		±3		°C

(1) The bias current can be set below the specified minimum according to the corresponding register setting; however, in closed loop operation settings below the specified value may trigger a fault.

## DC Electrical Characteristics (continued)

Over recommended operating conditions, open loop operation,  $V_{OUT} = 2 V_{PP}$  single-ended,  $I_{(BIAS)} = 80 \text{ mA}$ , unless otherwise noted. Typical operating condition is at  $V_{CC} = 2.5 \text{ V}$  and  $T_A = 25^\circ\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{(PD)}$	Photodiode reverse bias voltage	APC active, $I_{(PD)} = 1500 \mu\text{A}$	1.3	2.3		V
	Photodiode fault current level	Percent of target $I_{(PD)}$ <sup>(2)</sup>		150%		
	Photodiode current monitor ratio	$I_{(MONP)} / I_{(PD)}$ with control bit PDRNG = 1X	10%	12.5%	15%	
		$I_{(MONP)} / I_{(PD)}$ with control bit PDRNG = 01	20%	25%	30%	
$I_{(MONP)} / I_{(PD)}$ with control bit TXPDRNG = 00		40%	50%	60%		
Monitor diode DMI accuracy		With external mid-scale calibration	-15%		15%	
Bias current monitor ratio		$I_{(MONB)} / I_{(BIAS)}$ (nominal 1/100 = 1%), $V_{(MONB)} < 1.5\text{V}$	0.9%	1%	1.1%	
Bias current DMI accuracy		$I_{(BIAS)} \geq 20 \text{ mA}$	-15%		15%	
Power supply monitor accuracy		With external mid-scale calibration	-2%		2%	
$V_{CC(RST)}$	$V_{CC}$ reset threshold voltage	$V_{CC}$ voltage level which triggers power-on reset		1.8	2.1	V
$V_{CC(RSTHYS)}$	$V_{CC}$ reset threshold voltage hysteresis			100		mV
$V_{(MONB-FLT)}$	Fault voltage at MONB	TXFLTEN = 1, TXDMONB = 0, Fault occurs if voltage at MONB exceeds this value	1.15	1.2	1.25	V
$V_{(MONP-FLT)}$	Fault voltage at MONP	TXFLTEN = 1, TXMONPFLT = 1, TXDMONP = 0, Fault occurs if voltage at MONP exceeds this value	1.15	1.2	1.25	V

(2) Specified by design over process, supply and temperature variation

## 6.6 AC Electrical Characteristics

Over recommended operating conditions, open loop operation,  $V_{OUT} = 2 V_{PP}$  single-ended,  $I_{(BIAS)} = 80$  mA unless otherwise noted. Typical operating condition is at  $V_{CC} = 2.5$  V and  $T_A = 25^\circ\text{C}$

## 7 Detailed Description

### 7.1 Overview

A simplified block diagram of the ONET1131EC is shown in [Functional Block Diagram](#).

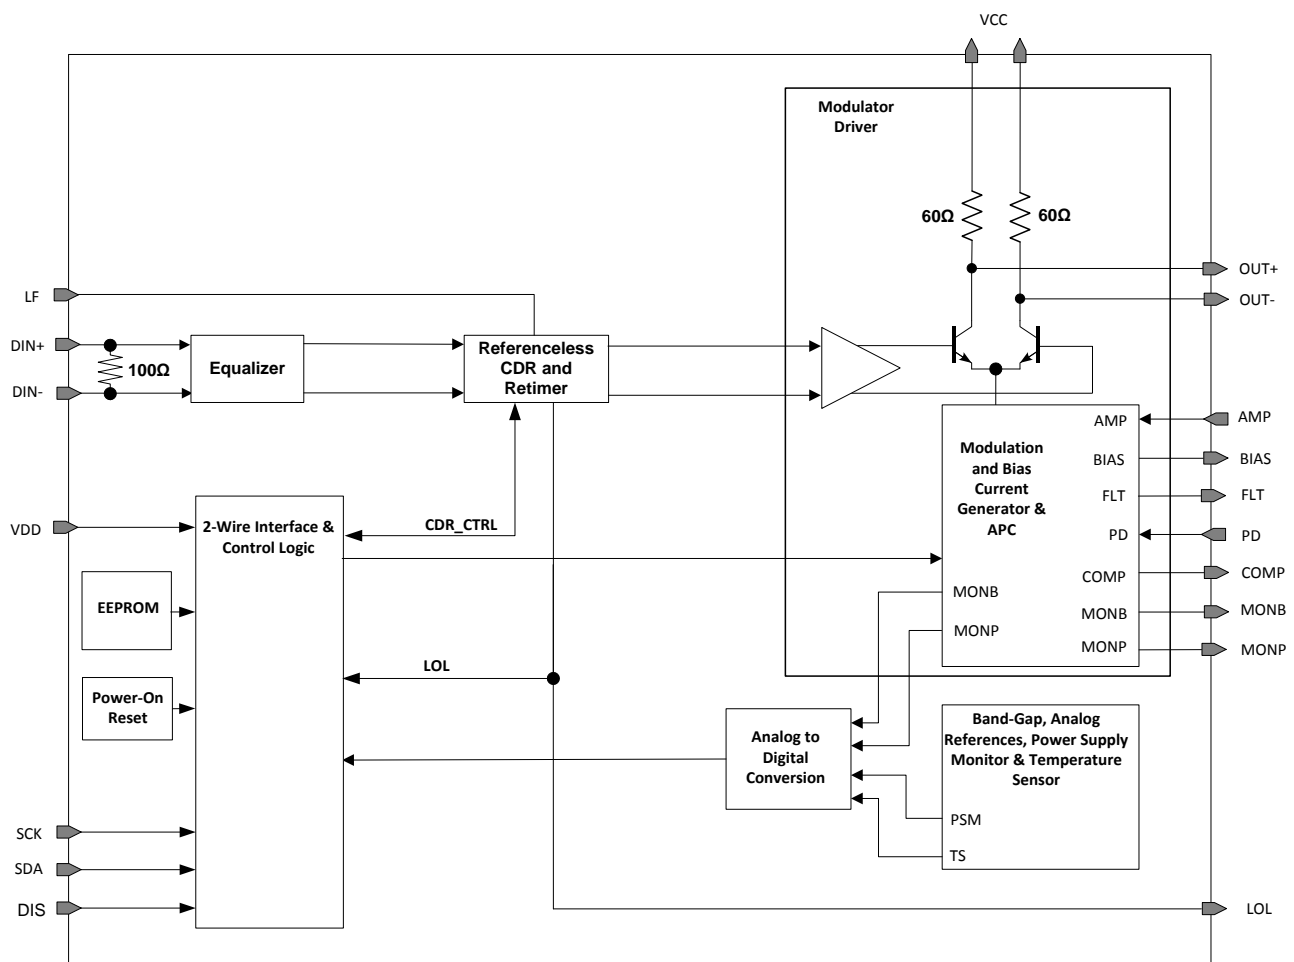

The ONET1131EC consists of a transmitter path, an analog reference block, an analog to digital converter, and a 2-wire serial interface and control logic block with power-on reset.

The transmit path consists of an adjustable input equalizer, a multi-rate CDR and an output modulator driver. The output driver provides a differential output voltage but can be operated in a single-ended mode to reduce the power consumption. Output waveform control, in the form of cross-point adjustment and de-emphasis are available to improve the optical eye mask margin. Bias current for the laser is provided and an integrated automatic power control (APC) loop to compensate for variations in average optical power over voltage, temperature and time is included.

The ONET1131EC contains an analog to digital converter to support transceiver digital diagnostics and can report the supply voltage, laser bias current, laser photodiode current and internal temperature.

The 2-wire serial interface is used to control the operation of the device and read the status of the control registers.

### 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Equalizer

The data signal is applied to an input equalizer by means of the input signal pins DIN+ / DIN–, which provide on-chip differential 100-Ω line termination. The equalizer is enabled by default and can be disabled by setting the transmitter equalizer disable bit TXEQ\_DIS = 1 (bit 1 of [register 10](#)). Equalization of up to 300 mm (12 inches) of microstrip or stripline transmission line on FR4 printed circuit boards can be achieved. The amount of equalization is set through register settings TXCTLE [0..3] ([register 11](#)). The device can accept input amplitude levels from 100 mVpp up to 1000 mVpp.

### 7.3.2 CDR

The clock and data recovery function consists of a Phase-Locked Loop (PLL) and retimer. The CDR can be operated without a reference clock and the Voltage Controlled Oscillator (VCO) can cover 9.8 Gbps to 11.7 Gbps data rates. The PLL is phase locked to the incoming data stream and attenuates the high frequency jitter on the data, producing a recovered clean clock with substantially reduced jitter. An external capacitor for the PLL loop filter is connected to the LF pin. A value of 2.2 nF is recommended. The clean clock is used to retimer the incoming data, producing an output signal with reduced jitter, and in effect, resetting the jitter budget for the transmitter.

The CDR is enabled by default. The CDR can be disabled and bypassed by setting the transmitter CDR disable bit TXCDR\_DIS = 1 (bit 4 of [register 10](#)). Alternatively, the CDR can be left powered on but bypassed by setting the transmitter CDR bypass bit TX\_CDRBP = 1 (bit 3 of [register 10](#)); however, this function only works if the receiver CDR bypass bit RX\_CDRBP (bit 3 of [register 4](#)) is also set to 1.

The CDR is designed to meet the XFP Datacom requirements and Telecom requirements for a maximum of 1-dB jitter peaking at a frequency greater than 120 kHz. The CDR is not designed to meet the Telecom regenerator requirements of jitter peaking less than 0.03 dB at a frequency less than 120 kHz. The default CDR bandwidth is typically 4.5 MHz and can be adjusted using the SEL\_RES[0..2] bits (bits 5 to 7 of [register 51](#)). Adjusting these bits changes the bandwidth of both the transmitter and receiver CDRs.

For the majority of applications, the default settings in [register 19](#) for the transmitter CDR can be used. However, for some applications or for test purposes, some modes of operation may be useful. The frequency detector for the PLL is set to an automatic mode of operation by default. When a signal is applied to the transmitter input the frequency detector search algorithm will be initiated to determine the frequency of the data. The default algorithm ensures a fast CDR lock time of less than 2 ms. The fast lock can be disabled by setting the transmitter CDR fast lock disable bit TXFL\_DIS = 1 (bit 3 of [register 19](#)). Once the frequency has been detected then the frequency detector will be disabled and the supply current will decrease by approximately 10mA. In some applications, such as when there are long periods of idle data, it may be advantageous to keep the frequency detector permanently enabled by setting the transmitter frequency detector enable bit TXFD\_EN = 1 (bit 5 of [register 19](#)). For test purposes, the frequency detector can be permanently disabled by setting the transmitter frequency detector disable bit TXFD\_DIS = 1 (bit 4 of [register 19](#)). For fast lock times the frequency detector can be set to one of two preselected data rates using the transmitter frequency detection mode selection bits TXFD\_MOD[0..1] (bits 6 and 7 of [register 19](#)). If it is desired to use the retimer at lower data rates than the standard 9.8 to 11.7Gbps then the transmitter divider ratio should be adjusted accordingly through TXDIV[0..2] (bits 0 to 2 of [register 19](#)). For example, for re-timed operation at 2.5 Gbps the divider should be set to divide by 4.

### 7.3.3 Modulator Driver

The modulation current is sunk from the common emitter node of the limiting output driver differential pair by means of a modulation current generator, which is digitally controlled by the 2-wire serial interface.

The collector nodes of the output stages are connected to the transmitter output pins TXOUT+ and TXOUT–. The collectors have internal 50Ω back termination resistors to VCC\_TX. The outputs are optimized to drive a 50 Ω single-ended load and to obtain the maximum single-ended output voltage of 2.0Vpp, AC coupling and inductive pull-ups to VCC are required. For reduced power consumption the DC resistance of the inductive pull-ups should be minimized to provide sufficient headroom on the TXOUT+ and TXOUT– pins.

The polarity of the output pins can be inverted by setting the transmitter output polarity switch bit, TXOUTPOL (bit 5 of [register 10](#)) to 1. In addition, the output driver can be disabled by setting the transmitter output driver disable bit TXOUT\_DIS = 1 (bit 6 of [register 10](#)).

## Feature Description (continued)

The output driver is set to differential output by default. In order to reduce the power consumption for single-ended applications driving an electroabsorptive modulated laser (EML) the output drive [register 13](#) should be set to single-ended mode. The single-ended output signal is enabled by setting the transmitter mode select bit TXMODE = 1 (bit 6 of [register 13](#)). The positive output is active by default. To enable the negative output and disable the positive output set TXOUTSEL = 1 (bit 7 of [register 13](#)).

Output de-emphasis can be applied to the signal by adjusting the transmitter de-emphasis bits TXDEADJ[0..3] (bits 0 to 3 of [register 13](#)). In addition, the width of the applied de-emphasis can be increased by setting the transmitter output peaking width TXPKSEL = 1 (bit 6 of [register 11](#)). The wide peaking width would typically be useful for a more capacitive transmitter load. How de-emphasis is applied is controlled through the TXSTEP bit (bit 5 of [register 13](#)). Setting TXSTEP = 1 delays the time of the applied de-emphasis and has more of an impact on the falling edge. A graphical representation of the two de-emphasis modes is shown in [Figure 23](#). Using de-emphasis can help to optimize the transmitted output signal; however, it will add to the power consumption.

The output edge speed can be set to slow mode of operation through the TXSLOW bit (bit 4 of [register 13](#)). For transmitter modulation output settings (TXMOD - [register 12](#)) below 0xC0 it is recommended to set TXSLOW = 1 to reduce the output jitter.

**Figure 23. Transmitter De-Emphasis Modes**

### 7.3.4 Modulation Current Generator

The modulation current generator provides the current for the high speed output driver described above. The circuit can be digitally controlled through the 2-wire interface block or controlled by applying an analog voltage in the range of 0 to 2 V to the AMP pin. The default method of control is through the 2-wire interface. To use the AMP pin set the transmitter amplitude control bit TXAMPCTRL = 1 (bit 0 of [register 10](#)).

An 8-bit wide control bus, TXMOD[0..7] ([register 12](#)), is used to set the desired modulation current and the output voltage.

The entire transmitter signal path, including CDR, can be disabled and powered down by setting TX\_DIS = 1 (bit 7 of [register 10](#)).

## Feature Description (continued)

### 7.3.5 DC Offset Cancellation and Cross Point Control

The ONET1131EC transmitter has DC offset cancellation to compensate for internal offset voltages. The offset cancellation can be disabled by setting TXOC\_DIS = 1 (bit 2 of [register 10](#)).

The crossing point can be moved toward the one level by setting TXCPSGN = 1 (bit 7 of [register 14](#)) and it can be moved toward the zero level by setting TXCPSGN = 0. The percentage of shift depends upon the register settings of the transmitter cross-point adjustment bits TXCPADJ[0..6] ([register 14](#)).

### 7.3.6 Bias Current Generation and APC Loop

The bias current for the laser is turned off by default and has to be enabled by setting the laser bias current enable bit TXBIASEN = 1 (bit 2 of [register 1](#)). In open loop operation, selected by setting TXOLENA = 1 (bit 4 of [register 1](#)), the bias current is set directly by the 10-bit wide control word TXBIAS[0..9] ([register 15](#) and [register 16](#)). In Automatic Power Control (APC) mode, selected by setting TXOLENA = 0, the bias current depends on the register settings TXBIAS[0..9] and the coupling ratio (CR) between the laser bias current and the photodiode current.  $CR = I_{BIAS}/I_{PD}$ . If the photodiode cathode is connected to VCC and the anode is connected to the PD pin (PD pin is sinking current) set TXPDPOL = 1 (bit 0 of [register 1](#)). If the photodiode anode is connected to ground and the cathode is connected to the PD pin (PD pin is sourcing current), set TXPDPOL = 0.

Three photodiode current ranges can be selected by means of the photodiode current range bits TXPDRNG[0..1] (bits 5 and 6 of [register 1](#)). The photodiode range should be chosen to keep the laser bias control DAC, TXBIAS[0..9], close to the center of its range. This keeps the laser bias current set point resolution high. For details regarding the bias current setting in open-loop mode as well as in closed-loop mode, see the [Register Mapping](#) table.

The ONET1131EC has the ability to source or sink the bias current. The default condition is for the BIAS pin to source the current (TXBIASPOL = 0). To act as a sink, set TXBIASPOL = 1 (bit 1 of [register 1](#)).

The bias current is monitored using a current mirror with a gain equal to 1/100. By connecting a resistor between MONB and GND, the bias current can be monitored as a voltage across the resistor. A low temperature coefficient precision resistor should be used. The bias current can also be monitored as a 10 bit unsigned digital word by setting the transmitter bias current digital monitor selection bit TXDMONB = 1 (bit 5 of [register 16](#)) and removing the resistor from MONB to ground.

The photodiode current is monitored using a current mirror with various gains that are dependent upon the photodiode current range being used. By connecting a resistor between MONP and GND, the photodiode current can be monitored as a voltage across the resistor. A low temperature coefficient precision resistor should be used. The photodiode current can also be monitored as a 10 bit unsigned digital word by setting the transmitter photodiode current digital monitor selection bit TXDMONP = 1 (bit 6 of [register 16](#)) and removing the resistor from MONP to ground.

### 7.3.7 Laser Safety Features and Fault Recovery Procedure

The ONET1131EC provides built in laser safety features. The following fault conditions are detected if the transmitter fault detection enable bit TXFLTEN = 1 (bit 3 of [register 1](#)):

1. Voltage at MONB exceeds the bandgap voltage (1.2 V) or, alternately, if TXDMONB = 1 and the bias current exceeds the bias current monitor fault threshold set by TXBMF[0..7] ([register 17](#)). When using the digital monitor, the resistor from the MONB pin to ground must be removed.
2. Voltage at MONP exceeds the bandgap voltage (1.2 V) and the analog photodiode current monitor fault trigger bit, TXMONPFLT (bit 7 of [register 1](#)), is set to 1. Alternately, a fault can be triggered if TXDMONP = 1 and the photodiode current exceeds the photodiode current monitor fault threshold set by TXPMF[0..7] ([register 18](#)). When using the digital monitor, the resistor from the MONP pin to ground must be removed.
3. Photodiode current exceeds 150% of its set value,
4. Bias control DAC drops in value by more than 50% in one step.

If the fault detection is being used then to avoid a fault from occurring at start-up it is recommended to set up the required bias current and APC loop conditions first and enable the laser bias current (TXBIASEN = 1) as the last step in the sequence of commands.

## Feature Description (continued)

If one or more fault conditions occur and the transmitter fault enable bit TXFLTEN is set to 1, the ONET1131EC responds by:

1. Setting the bias current to zero.
2. Asserting and latching the TX\_FLT pin.
3. Setting the TX\_FLT bit (bit 5 of [register 43](#)) to 1.

Fault recovery is performed by the following procedure:

1. The transmitter disable pin TX\_DIS and/or the transmitter bias current enable bit TXBIASEN are toggled for at least the fault latch reset time.
2. The TX\_FLT pin de-asserts while the transmitter disable pin TX\_DIS is asserted or the transmitter bias current enable bit TXBIASEN is de-asserted.
3. If the fault condition is no longer present, the part returns to normal operation with its prior output settings after the disable negate time.
4. If the fault condition is still present, TX\_FLT re-asserts once TX\_DIS is set to a low level and/or TXBIASEN is set to 0 and the part will not return to normal operation.

### 7.3.8 Analog Block

#### 7.3.8.1 Analog Reference and Temperature Sensor

The ONET1131EC is supplied by a single 2.5 V  $\pm 5\%$  supply voltage connected to the VCC and VDD pins. This voltage is referred to ground (GND) and can be monitored as a 10 bit unsigned digital word through the 2-wire interface.

On-chip bandgap voltage circuitry generates a reference voltage, independent of the supply voltage, from which all other internally required voltages and bias currents are derived.

In order to minimize the module component count, the ONET1131EC provides an on-chip temperature sensor. The temperature can be monitored as a 10 bit unsigned digital word through the 2-wire interface.

#### 7.3.8.2 Power-On Reset

The ONET1131EC has power on reset circuitry which ensures that all registers are reset to default values during startup. After the power-on to initialize time ( $t_{INIT1}$ ), the internal registers are ready to be loaded. The part is ready to transmit data after the initialize to transmit time ( $t_{INIT2}$ ), assuming that the enable chip bit EN\_CHIP = 1 (bit 0 of [register 0](#)). In addition, the disable pin DIS must be set to zero.

The ONET1131EC bias current can be disabled by setting the DIS pin high. The internal registers are not reset. After the transmitter disable pin DIS is set low the part returns to its prior output settings.

#### 7.3.8.3 Analog to Digital Converter

The ONET1131EC has an internal 10 bit analog to digital converter (ADC) that converts the analog monitors for temperature, power supply voltage, bias current and photodiode current into a 10 bit unsigned digital word. The first 8 most significant bits (MSBs) are available in [register 40](#) and the 2 least significant bits (LSBs) are available in [register 41](#). Depending on the accuracy required, 8 bits or 10 bits can be read. However, due to the architecture of the 2-wire interface, in order to read the 2 registers, 2 separate read commands have to be sent.

The ADC is enabled by default so to monitor a particular parameter, select the parameter with ADCSEL[0..2] (bits 0 to 2 of [register 3](#)). [Table 1](#) shows the ADCSEL bits and the parameter that is monitored.

**Table 1. ADC Selection Bits and the Monitored Parameter**

ADCSEL2	ADCSEL1	ADCSEL0	MONITORED PARAMETER
0	0	0	Temperature
0	0	1	Supply voltage
0	1	0	Bias current
0	1	1	Photodiode current

To digitally monitor the photodiode current, ensure that TXDMONP = 1 (bit 6 of [register 16](#)) and that a resistor is not connected to the MONP pin. To digitally monitor the bias current, ensure that TXDMONB = 1 (bit 5 of [register 16](#)) and that a resistor is not connected to the MONB pin. The ADC is disabled by default. To enable the ADC, set the ADC oscillator enable bit OSCEN = 1 (bit 6 of [register 3](#)) and set the ADC enable bit ADCEN = 1 (bit 7 of [register 3](#)).

The digital word read from the ADC can be converted to its analog equivalent through the following formulas.

#### 7.3.8.3.1 Temperature

$$\text{Temperature (}^\circ\text{C)} = (0.5475 \times \text{ADCx}) - 273 \quad (1)$$

#### 7.3.8.3.2 Power Supply Voltage

$$\text{Power supply voltage (V)} = (1.36\text{m} \times \text{ADCx}) + 1.76 \quad (2)$$

#### 7.3.8.3.3 Photodiode Current Monitor

$$\text{IPD}(\mu\text{A}) = 2 \times [ (0.62 \times \text{ADCx}) - 16 ] \text{ for TXPDRNG00} \quad (3)$$

$$\text{IPD}(\mu\text{A}) = 4 \times [ (0.62 \times \text{ADCx}) - 16 ] \text{ for TXPDRNG01} \quad (4)$$

$$\text{IPD}(\mu\text{A}) = 8 \times [ (0.62 \times \text{ADCx}) - 16 ] \text{ for TXPDRNG1x} \quad (5)$$

#### 7.3.8.3.4 Bias Current Monitor

$$\text{IBIAS (mA)} = (0.2 \times \text{ADCx}) - 4.5 \quad (6)$$

Where: ADCx = the decimal value read from the ADC

### 7.3.8.4 2-Wire Interface and Control Logic

The ONET1131EC uses a 2-wire serial interface for digital control. The two circuit inputs, SDA and SCK, are driven, respectively, by the serial data and serial clock from a microprocessor, for example. The SDA and SCK pins require external 4.7-k $\Omega$  to 10-k $\Omega$  pull-up resistor to VCC for proper operation.

The 2-wire interface allows write access to the internal memory map to modify control registers and read access to read out the control signals. The ONET1131EC is a slave device only which means that it cannot initiate a transmission itself; it always relies on the availability of the SCK signal for the duration of the transmission. The master device provides the clock signal as well as the START and STOP commands. The protocol for a data transmission is as follows:

1. START command
2. Seven (7) bit slave address (0001000) followed by an eighth bit which is the data direction bit (R/W). A zero indicates a WRITE and a 1 indicates a READ.
3. 8 bit register address
4. 8 bit register data word
5. STOP command

Regarding timing, the ONET1131EC is I<sup>2</sup>C compatible. The typical timing is shown in [Figure 2](#) and a complete data transfer is shown in [Figure 24](#). Parameters for [Figure 2](#) are defined in the [Timing Diagram Definitions](#).

#### 7.3.8.5 Bus Idle

Both SDA and SCK lines remain HIGH

#### 7.3.8.6 Start Data Transfer

A change in the state of the SDA line, from HIGH to LOW, while the SCK line is HIGH, defines a START condition (S). Each data transfer is initiated with a START condition.

#### 7.3.8.7 Stop Data Transfer

A change in the state of the SDA line from LOW to HIGH while the SCK line is HIGH defines a STOP condition (P). Each data transfer is terminated with a STOP condition; however, if the master still wishes to communicate on the bus, it can generate a repeated START condition and address another slave without first generating a STOP condition.

### 7.3.8.8 Data Transfer

Only one data byte can be transferred between a START and a STOP condition. The receiver acknowledges the transfer of data.

### 7.3.9 Acknowledge

Each receiving device, when addressed, is obliged to generate an acknowledge bit. The transmitter releases the SDA line and a device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a slave-receiver doesn't acknowledge the slave address, the data line must be left HIGH by the slave. The master can then generate a STOP condition to abort the transfer. If the slave-receiver does acknowledge the slave address but some time later in the transfer cannot receive any more data bytes, the master must abort the transfer. This is indicated by the slave generating the not acknowledge on the first byte to follow. The slave leaves the data line HIGH and the master generates the STOP condition, see [Figure 2](#).

## 7.4 Device Functional Modes

The ONET1131EC has two main functional modes of operation: differential transmitter output and single-ended transmitter output.

### 7.4.1 Differential Transmitter Output

Operation with differential output is the default mode of operation. This mode is intended for externally modulated lasers requiring differential drive such as Mach Zehnder modulators.

### 7.4.2 Single-Ended Transmitter Output

In order to reduce the power consumption for single-ended EML applications the output driver should be set to single-ended mode. The single-ended output signal can be enabled by setting the transmitter mode select bit TXMODE = 1 (bit 6 of [register 13](#)). The positive output is active by default. To enable the negative output and disable the positive output set TXOUTSEL = 1 (bit 7 of [register 13](#)).

## 8 Application Information and Implementations

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The ONET1131EC is designed to be used in conjunction with a Transmitter Optical Sub-Assembly (TOSA). The ONET1131EC, TOSA, microcontroller and power management circuitry will typically be used in an XFP or SFP+ 10 Gbps optical transceiver. Figure 49 shows the ONET1131EC in differential mode of operation modulating a differentially driven Mach Zehnder (MZ) modulator TOSA and Figure 51 and Figure 52 show the device in single-ended output mode with an Electroabsorptive Modulated Laser (EML) TOSA. Figure 51 has the photodiode cathode available and Figure 52 has the photodiode anode available.

### 8.2 Typical Application, Transmitter Differential Mode

Figure 49. Typical Application Circuit in Differential Mode

## Typical Application, Transmitter Differential Mode (continued)

### 8.2.1 Design Requirements

Table 26. Design Parameters

PARAMETER	VALUE
Supply voltage	2.5 V
Transmitter input voltage	100 mVpp to 1000 mVpp differential
Transmitter output voltage	1 Vpp to 3.6 Vpp differential

### 8.2.2 Detailed Design Procedure

In the transmitter differential mode of operation, the output driver is intended to be used with a differentially driven Mach Zehnder (MZ) modulator TOSA. On the input side, the DIN+ and DIN- pins are required to be AC coupled to the signal from the host system and the input voltage should be between 100 mVpp and 1000 mVpp differential. On the output side, the OUT+ pin is AC coupled to the modulator positive input and the OUT- pin is AC coupled to the modulator negative input. A bias-T from VCC to both the OUT+ and OUT- pins is required to supply sufficient headroom voltage for the output driver transistors. It is recommended that the inductance in the bias-T have low DC resistance to limit the DC voltage drop and maximize the voltage supplied to the OUT+ and OUT- pins. If the voltage on these pins drops below approximately 2.1 V then the output rise and fall times can be adversely affected.

### 8.2.3 Application Curve

Figure 51. Typical Application Circuit in Single-Ended Mode with an EML and the PD Monitor Cathode Available

Copyright © 2016, Texas Instruments Incorporated

Figure 52. Typical Application Circuit in Single-Ended Mode with an EML and the PD Monitor Anode Available

### 8.2.4.1 Design Requirements

**Table 27. Design Parameters**

PARAMETER	VALUE
Supply voltage	2.5 V
Transmitter input voltage	100 mVpp to 1000 mVpp differential
Transmitter output voltage	0.5 Vpp to 2 Vpp single-ended

### 8.2.4.2 Detailed Design Procedure

In the transmitter single-ended mode of operation, the output driver is intended to be used with a single-ended driven Electroabsorptive Modulated Laser (EML) TOSA. On the input side, the DIN+ and DIN– pins are required to be AC coupled to the signal from the host system and the input voltage should be between 100 mVpp and 1000 mVpp differential. On the output side, it is recommended that the OUT+ pin is AC coupled to the modulator input and the OUT– pin can be left unterminated or terminated to VCC through a 50-Ω resistor. A bias-T from VCC to the OUT+ pin is required to supply sufficient headroom voltage for the output driver transistors. It is recommended that the inductance in the bias-T have low DC resistance to limit the DC voltage drop and maximize the voltage supplied to the TXOUT+ pin. If the voltage on this pins drops below approximately 2.1V then the output rise and fall times can be adversely affected.

### 8.2.4.3 Application Curves

**Figure 53. Single-Ended Mode Transmitter Output Eye Diagram**

## 9 Power Supply Recommendations

The ONET1131EC is designed to operate from an input supply voltage range between 2.37 V and 2.63 V. To reduce digital coupling into the analog circuitry, there are separate supplies for the transmitter, and digital circuitry. VCC is used to supply power to the transmitter, and VDD is used to supply power to the digital block. Power supply decoupling capacitors should be placed as close as possible to the respective power supply pins.

## 10 Layout

### 10.1 Layout Guidelines

For optimum performance, use 50-Ω transmission lines (100-Ω differential) for connecting the high speed inputs and outputs. The length of transmission lines should be kept as short as possible to reduce loss and pattern-dependent jitter.

If the single-ended mode of operation is being used (TXMODE = 1) then it is recommended to terminate the unused output with a 50-Ω resistor to VCC. Figure 54 shows a typical layout for the high speed inputs and outputs.

### 10.2 Layout Example

Figure 54. Board Layout

## 11 器件和文档支持

### 11.1 接收文档更新通知

如需接收文档更新通知，请访问 [www.ti.com.cn](http://www.ti.com.cn) 网站上的器件产品文件夹。点击右上角的提醒我 (Alert me) 注册后，即可每周定期收到已更改的产品信息。有关更改的详细信息，请查阅已修订文档中包含的修订历史记录。

### 11.2 社区资源

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At [e2e.ti.com](http://e2e.ti.com), you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

## 12 机械、封装和可订购信息

以下页中包括机械、封装和可订购信息。这些信息是针对指定器件可提供的最新数据。这些数据会在无通知且不对本文档进行修订的情况下发生改变。欲获得该数据表的浏览器版本，请查阅左侧的导航栏。

## 重要声明

德州仪器(TI)及其下属子公司有权根据 JESD46 最新标准,对所提供的产品和服务进行更正、修改、增强、改进或其它更改,并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息,并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内,且 TI 认为有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定,否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险,客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予的直接或隐含权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息,不能构成从 TI 获得使用这些产品或服务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可,或是 TI 的专利权或其它知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分,仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时,如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分,则会失去相关 TI 组件或服务的所有明示或暗示授权,且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意,尽管任何应用相关信息或支持仍可能由 TI 提供,但他们将独立负责满足与其产品及其在应用中使用的 TI 产品相关的所有法律、法规和安全相关要求。客户声明并同意,他们具备制定与实施安全措施所需的全部专业技术和知识,可预见故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中,为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此,此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备)的授权许可,除非各方授权官员已经达成了专门管控此类使用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同意,对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用,其风险由客户单独承担,并且由客户独立负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品,这些产品主要用于汽车。在任何情况下,因使用非指定产品而无法达到 ISO/TS16949 要求, TI 不承担任何责任。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ONET1131ECSRMR	ACTIVE	VQFN	RSM	32	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 100	ONET 1131EC	<a href="#">Samples</a>
ONET1131ECSMT	ACTIVE	VQFN	RSM	32	250	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 100	ONET 1131EC	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

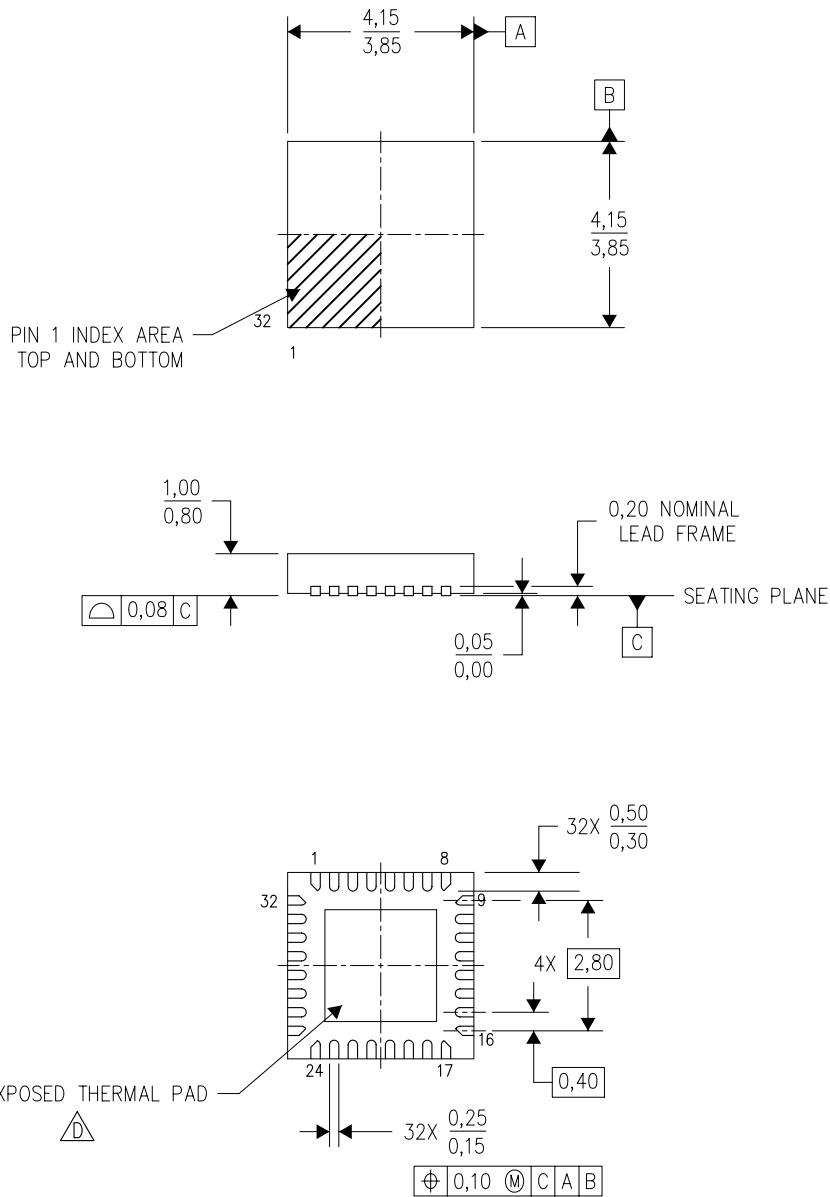

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

4207560/B 03/10

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - B. This drawing is subject to change without notice.
  - C. QFN (Quad Flatpack No-Lead) Package configuration.
  -  The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.

RSM (S-PVQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTE: All linear dimensions are in millimeters

RSM (S-PVQFN-N32)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

## 重要声明

德州仪器(TI) 及其下属子公司有权根据 JESD46 最新标准, 对所提供的产品和服务进行更正、修改、增强、改进或其它更改, 并有权根据 JESD48 最新标准中止提供任何产品和服务。客户在下订单前应获取最新的相关信息, 并验证这些信息是否完整且是最新的。所有产品的销售都遵循在订单确认时所提供的TI 销售条款与条件。

TI 保证其所销售的组件的性能符合产品销售时 TI 半导体产品销售条件与条款的适用规范。仅在 TI 保证的范围内, 且 TI 认为有必要时才会使用测试或其它质量控制技术。除非适用法律做出了硬性规定, 否则没有必要对每种组件的所有参数进行测试。

TI 对应用帮助或客户产品设计不承担任何义务。客户应对其使用 TI 组件的产品和应用自行负责。为尽量减小与客户产品和应用相关的风险, 客户应提供充分的设计与操作安全措施。

TI 不对任何 TI 专利权、版权、屏蔽作品权或其它与使用了 TI 组件或服务的组合设备、机器或流程相关的 TI 知识产权中授予的直接或间接版权限作出任何保证或解释。TI 所发布的与第三方产品或服务有关的信息, 不能构成从 TI 获得使用这些产品或服务的许可、授权、或认可。使用此类信息可能需要获得第三方的专利权或其它知识产权方面的许可, 或是 TI 的专利权或其它知识产权方面的许可。

对于 TI 的产品手册或数据表中 TI 信息的重要部分, 仅在没有对内容进行任何篡改且带有相关授权、条件、限制和声明的情况下才允许进行复制。TI 对此类篡改过的文件不承担任何责任或义务。复制第三方的信息可能需要服从额外的限制条件。

在转售 TI 组件或服务时, 如果对该组件或服务参数的陈述与 TI 标明的参数相比存在差异或虚假成分, 则会失去相关 TI 组件或服务的所有明示或暗示授权, 且这是不正当的、欺诈性商业行为。TI 对任何此类虚假陈述均不承担任何责任或义务。

客户认可并同意, 尽管任何应用相关信息或支持仍可能由 TI 提供, 但他们将独自负责满足与其产品及其应用中使用 TI 产品相关的所有法律、法规和安全相关要求。客户声明并同意, 他们具备制定与实施安全措施所需的全部专业技术和知识, 可预见故障的危险后果、监测故障及其后果、降低有可能造成人身伤害的故障的发生机率并采取适当的补救措施。客户将全额赔偿因在此类安全关键应用中使用任何 TI 组件而对 TI 及其代理造成的任何损失。

在某些场合中, 为了推进安全相关应用有可能对 TI 组件进行特别的促销。TI 的目标是利用此类组件帮助客户设计和创立其特有的可满足适用的功能安全性标准和要求的终端产品解决方案。尽管如此, 此类组件仍然服从这些条款。

TI 组件未获得用于 FDA Class III (或类似的生命攸关医疗设备) 的授权许可, 除非各方授权官员已经达成了专门管控此类使用的特别协议。

只有那些 TI 特别注明属于军用等级或“增强型塑料”的 TI 组件才是设计或专门用于军事/航空应用或环境的。购买者认可并同意, 对并非指定面向军事或航空航天用途的 TI 组件进行军事或航空航天方面的应用, 其风险由客户单独承担, 并且由客户独自负责满足与此类使用相关的所有法律和法规要求。

TI 已明确指定符合 ISO/TS16949 要求的产品, 这些产品主要用于汽车。在任何情况下, 因使用非指定产品而无法达到 ISO/TS16949 要求, TI 不承担任何责任。
