### 说明

THS6226 是一款双端口、H 类、电流反馈架构、差分线路驱动器放大器系统,非常适合于 xDSL 系统。该器件旨在应用于 VDSL2 (超高位速率数字用户线路 2) 线路驱动器系统,此类系统可启用本地 DTM 信号,同时支持高于 +20.5dBm 的线路功率(在高达 8.5MHz 的频率条件下)和上佳的线性度,从而支持 G.993.2 VDSL2 8b 传输模式。另外,它还拥有足以支持 +14.5dBm 线路功率(在高达 30MHz 的频率下)的中心局传输的高速度。

THS6226 的独特架构提供了极小的静态电流,同时仍然实现了超高的线性度。在全偏置条件和 1MHz 频率下,差分失真为 -91dBc,而在 5MHz 频率下则降至仅 -75dBc。对于并不需要放大器全部性能的线路长度,放大器的多种固定偏置设定值可提升节能效果。为了在所有的传输模式中提供更大的灵活性及节能幅度,可对静态电流进行数字式调节(调节范围从 7.67mA 至 23mA),并具有一个 1.0mA 的偏置电流步进。对于那些希望在不进行传输的时候实现更多节能的系统,THS6226 可在其线路终端模式中使用,以保持阻抗匹配。

采用 +12V 电源时的宽输出摆幅与出色的电流驱动能力相结合,提供了宽动态余量,从而将失真抑制在极低的水平上。

THS6226 采用 QFN-32 PowerPAD™ 封装。

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

- (1) Stresses above those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute maximum rated conditions for extended periods may degrade device reliability.
- (2) The THS6226 incorporates a PowerPAD on the underside of the chip. This acts as a heatsink and must be connected to a thermally dissipating plane for proper power dissipation. Failure to do so may result in exceeding the maximum junction temperature which could permanently damage the device. See TI Technical Brief [SLMA002](#) for more information about utilizing the PowerPAD thermally-enhanced package. Under high-frequency ac operation (> 10kHz), the short-term output current capability is much greater than the continuous dc output current rating. This short-term output current rating is about 8.5x the dc capability, or approximately ±850mA.
- (3) The absolute maximum junction temperature under any condition is limited by the constraints of the silicon process.
- (4) The absolute maximum junction temperature for continuous operation is limited by the package constraints. Operation above this temperature may result in reduced reliability and/or lifetime of the device.

## PIN CONFIGURATIONS

### QFN-32<sup>(1)(2)</sup> RHB PACKAGE (TOP VIEW)

- (1) The PowerPAD is electrically isolated from all other pins and can be connected to any potential voltage range from  $V_{S-}$  to  $V_{S+}$ . Typically, the PowerPAD is connected to the GND plane because this plane tends to physically be the largest and is able to dissipate the most amount of heat.
- (2) The THS6226 defaults to the disabled mode at power-up.

### APPLICATION INFORMATION

The THS6226 class H line driver provides exceptional ac performance in conjunction with wide output voltage swing. The class H operation allows voltage swings to exceed the power supply for short intervals limited only by the charge in the capacitor. In class AB mode, the THS6226 is capable of driving a 60Ω load from +1.9V to +10.1V. In class H mode, under the same conditions, the output voltage range becomes an impressive –5.5V to +17.5V, or 46V<sub>PP</sub> differentially with the capacitor fully charged.

Figure 20 shows a fully-differential, noninverting amplifier configuration with active impedance. In this configuration, the 10.2Ω matching resistance appears through the transformer as 100Ω, minimizing reflection on the line, while also minimizing transmission losses. The THS6226 gain is fixed and equal to 19V/V from input of the amplifier to the output of the amplifier (IN<sub>CD</sub> to OUT<sub>CD</sub>), not including the transformer-turn ratio.

To simplify the implementation as well as provide design flexibility, the THS6226 contains an integrated mid-supply buffer that provides the correct biasing to the amplifier core without requiring any external components. Also present is a two-pin serial interface that provides exceptional design flexibility and allows minimal power consumption for each xDSL profile.

## PROGRAMMING THE THS6226

Programming of the THS6226 is realized through a serial interface (pins 4 and 5) and proceeds in the following sequence.

Two start bits are required B0 = 0 followed by B1 = 1.

B2 through B9 are used to program the THS6226.

Refer to [Table 1](#) for the bit descriptions.

B10 (refer to [Table 2](#)) is the parity bit that controls if the word is or is not loaded.

B11 is the stop bit and should be set to B11 = 1. [Figure 21](#) shows the sequence to be adopted.

## QUIESCENT CURRENT

The quiescent current of the THS6226 is dissipated in two main modules of the THS6226: the class AB and the charge pump. B4 and B5 select the mode of operation, class AB operating with or without the charge pump enabled, powering down the entire port, or operating in a line termination mode. [Table 4](#) lists the details on each bit functionality and the approximate quiescent current.

The class AB quiescent current is set by bits B6 to B9, using B4 and B5 for the power-down function, and B2 and B3 for channel select. The approximate quiescent current for the amplifier core is shown in [Table 3](#).

**Table 3. Class AB Quiescent Current**

The various power modes are shown in [Table 4](#). For all modes, when B6 through B9 are not defined, set B9 = B8 = B7 = B6 = 0 to achieve the lowest power dissipation possible.

**Table 4. Power Modes**

B4 (PD1)	B5 (PD0)	POWER-DOWN MODE	APPROXIMATE $I_Q$ (mA/Port)

1	0	Class AB driver $I_Q$ set by B6 to B9, class H disabled	—
1	1	Class AB driver $I_Q$ set by B6 to B9, class H enabled	—

Channel selection is shown in [Table 5](#). Each channel can be programmed independently, or together if both B2 and B3 are set to '1'.

**Table 5. Channel Selection**

B2 (Channel AB)	B3 (Channel CD)	CHANNEL SELECT
0	0	Bits B4 to B9 are ignored
0	1	Channel B programmed with B4 to B9
1	0	Channel A programmed with B4 to B9
1	1	Channels A and B programmed with B4 to B9

At startup, the internal register is set as shown in [Table 6](#).

**Table 6. Internal Register**

0	0	0	0	0	0	0	0

In this condition, the total quiescent power dissipation is 10.2mW/port on a +12V supply.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.
