

SM803XXX

Flexible Ultra-Low Jitter Clock Synthesizer

Clockworks™ FLEX2

General Description

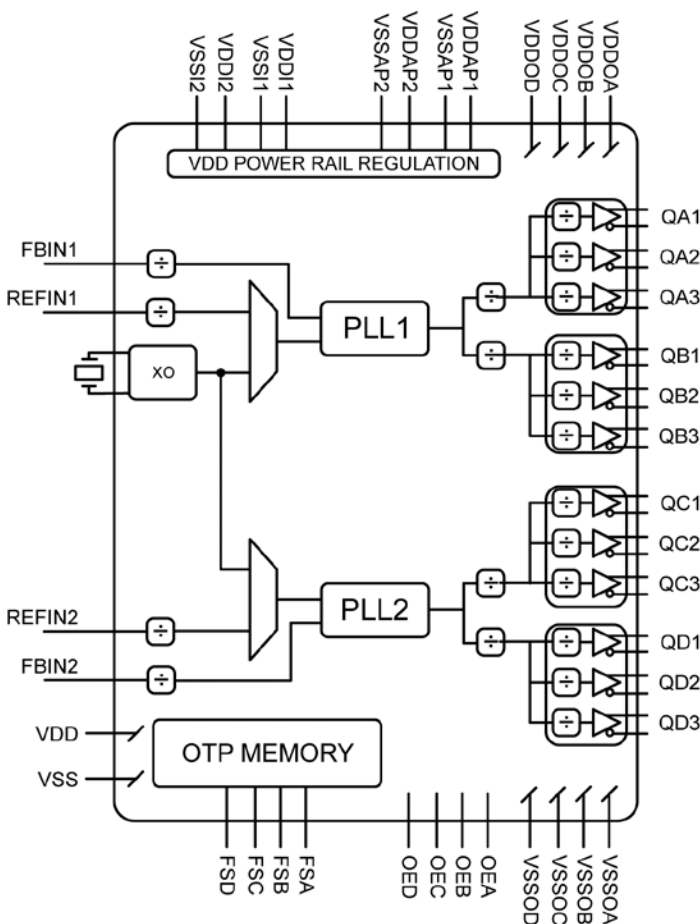

The SM803xxx is a dual-PLL clock generator that achieves ultra-low phase jitter (75fs RMS). With 12 total outputs and dividers on each output, this device can generate 12 different frequencies up to 850MHz, from a low-cost quartz crystal or a reference clock input.

Each of 12 outputs can be independently programmed to LVPECL, LVDS, HCSL, or LVCMOS logic. For LVCMOS, only the true side of the channel is used.

The SM803xxx is packaged in a 48-pin QFN with up to 10 outputs, or 84-pin QFN with 12 outputs.

Datasheets and support documentation are available on Micrel's web site at: www.micrel.com.

Features

- Generates up to 12 differential or single-ended frequencies
- 75fs phase jitter @ 156.25MHz (1.875MHz to 20MHz)
- 180fs phase jitter @ 156.25MHz (12kHz to 20MHz)
- On-chip power supply regulation for excellent power supply noise immunity
- Two high-performance PLL synthesizers to generate multiple frequencies
- Independently programmable output logic and frequency:
 - Output logic: LVPECL, LVDS, HCSL, LVCMOS
- Selectable input:
 - Crystal: 12MHz to 50MHz
 - Reference input: 12MHz to 850MHz
- SPI programmable (see FLEX SPI documentation)
- No external crystal oscillator capacitors required
- 2.5V or 3.3V operating power supply
- Separate output power supplies:
 - Each bank can be at different power supply voltage levels (4 banks of 3 outputs each)
- Feedback input pins for use as zero delay buffer
- Industrial temperature range, -40°C to +85°C
- Green, RoHS, and PFOS compliant QFN packages:
 - 84-pin, 7mm x 7mm (12 Diff. or Single ended outputs)
 - 48-pin 7mm x 7mm (10 Diff. or Single ended outputs)

Applications

- 1/10/40/100 Gigabit Ethernet – (GbE)
- SONET/SDH
- PCI-Express
- CPRI/OBSAI – Wireless base station
- Fibre Channel
- SAS/SATA
- DIMM (DDR2/DDR3/AMB)

Key Programmable Parameters

Frequency Settings for One PLL and One Output Bank

The REF input frequency can be from a crystal or from a reference clock input. If a crystal is used, the REF input frequency range is 12MHz to 50MHz.

The VCO in the PLL has a range of 2875MHz to 3510MHz.

Counters M and P0 have a range of 4 to 259.
Counters P1, P2 and P3 have a range of 1 to 16.

$$F_{VCO} = REF \times M$$

$$QD1 = F_{VCO} \div (P0 \times P1)$$

$$QD2 = F_{VCO} \div (P0 \times P2)$$

$$QD3 = F_{VCO} \div (P0 \times P3)$$

Output Logic Programming:

Available output logic types are LVPECL, LVDS, HCSSL, and LVCMOS.

Each output can be programmed individually to one of the four logic types.

All logic types are differential except LVCMOS. For LVCMOS, only the true channel of the output pair is enabled and the complementary channel is disabled. With LVCMOS there is also an output drive setting. There is one setting for all LVCMOS outputs, so all LVCMOS outputs will have the same drive strength.

Unused outputs are disabled to high impedance.

Input Selection

The reference input for the PLLs can be programmed to be either a crystal or a reference clock.

The crystal oscillator circuit has capacitors on the IC so external capacitors are not required.

There are two reference clock inputs, one for each PLL. Make sure they are connected to the same reference input source. The reference inputs can be differential or single-ended and require only a small amplitude. See [Figure 1](#) and [Figure 2](#).

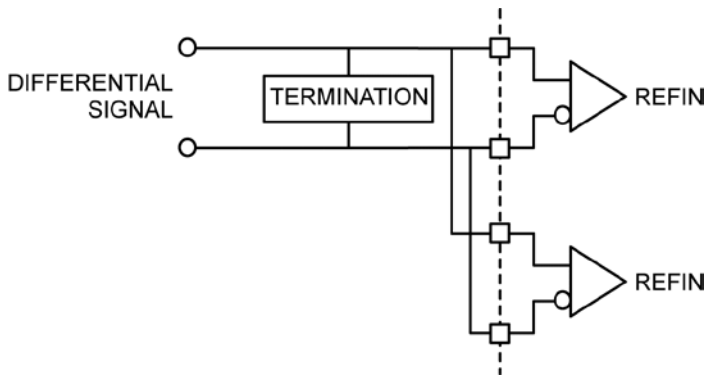

Figure 1. Differential Signal

The single-ended signal input can be LVCMOS, but smaller amplitudes like >800mVpp clipped sine wave from a TCXO will also work.

Frequency Select Programming

Each of the four output banks has a frequency select pin. For each bank, two P0, P1, P2 and P3 counter values can be programmed, a primary and a secondary value. The frequency select pin toggles between the two values assigned to each counter, changing the output frequencies.

Notes:

- See Figure 6.
- Output-to-output skew is defined as skew between outputs at the same supply voltage and with equal load conditions. It is measured at the output differential crossing points.
- Output-to-output skew is only defined for outputs in the same PLL bank [A:B, C:D] with the same output logic type setting.
- All phase noise measurements were taken with an Agilent 5052B phase noise system.
- Measured using a 25MHz crystal as the input reference source. If using an external reference input, use a low phase noise source. With an external reference, the phase noise will follow the input source phase noise up to about 1MHz.

Phase Noise Performance

156.25MHz, Integration Range 1.875MHz to 20MHz: 74.2fs RMS

156.25MHz, Integration Range 12kHz to 20MHz: 182.4fs RMS

156.25MHz, Integration Range 1.5MHz to 10MHz: 79.8fs RMS

Application Information

Input Reference

When operating with a crystal input reference, do not apply a switching signal to REF_IN.

Crystal Layout

Keep the layers under the crystal as open as possible and do not place switching signals or noisy supplies under the crystal. Crystal load capacitance is built inside the die, so no external capacitance is needed. See the *Selecting a Quartz crystal for the Clockworks Flex I Family of Precision Synthesizers* application note for further details.

Power Supply Filtering Recommendations

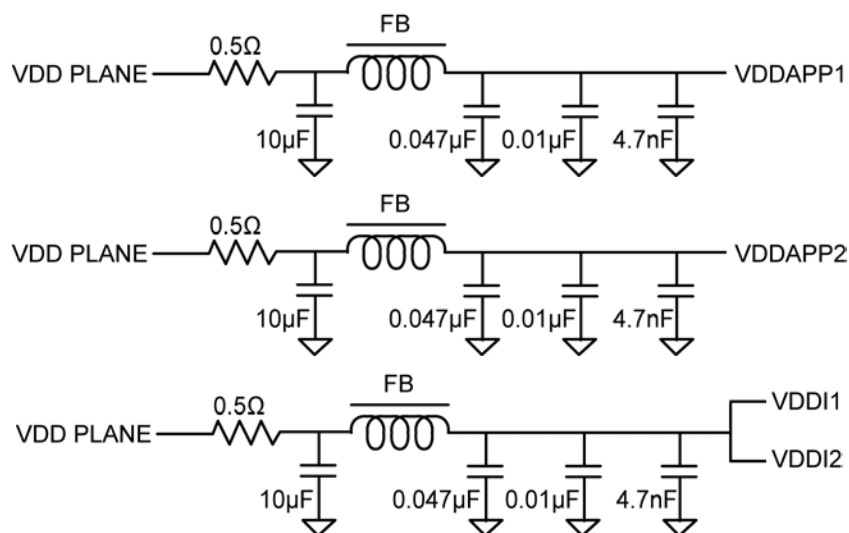

Figure 3. Recommended Power Supply Filtering

- Use the power supply filtering shown in Figure 3 for VDDAP1, VDDAP2, VDDI1 and VDDI2.
- Connect the VDDO and VDD pins directly to the VDD power plane.
- Connect all VSS pins directly to the ground power plane.
- Recommended ferrite bead properties are 240Ω to 600Ω impedance and >150mA saturation current.
- To improve power supply filtering beyond what a ferrite bead can provide, Micrel's Ripple Blocker™ provides a solution. MIC94300 or MIC94310 are recommended parts. The filter circuit with Ripple Blocker is shown in Figure 4 and can be used for any of the above VDD sections.
