25AA320A/25LC320A

32K SPI Bus Serial EEPROM

Device Selection Table

Part Number	Vcc Range	Page Size	Temperature Ranges	Packages
25AA320A	1.8V-5.5V	32 Byte	I	MS, P, SN, MNY, ST
25LC320A	2.5V-5.5V	32 Byte	I, E	MS, P, SN, MNY, ST

Features

- Maximum Clock 10 MHz
- Low-Power CMOS Technology:
  - Maximum Write Current: 5 mA at 5.5V, 10 MHz
  - Read Current: 5 mA at 5.5V, 10 MHz
  - Standby Current: 5 µA at 5.5V
- 4096 x 8-bit Organization
- 32-Byte Page
- Self-Timed Erase and Write Cycles (5 ms maximum)
- Block Write Protection:
  - Protect none, 1/4, 1/2 or all of array
- Built-in Write Protection:
  - Power-on/off data protection circuitry
  - Write enable latch
  - Write-protect pin
- Sequential Read
- High Reliability:
  - Endurance: >1M erase/write cycles
  - Data retention: > 200 years
  - ESD protection: > 4000V
- Temperature Ranges Supported:
  - Industrial (I): -40°C to +85°C
  - Extended (E): -40°C to +125°C
- RoHS Compliant
- Automotive AEC-Q100 Qualified

Packages

- 8-Lead MSOP, 8-Lead PDIP, 8-Lead SOIC, 8-Lead TDFN, 8-Lead TSSOP

Pin Function Table

Name	Function
$\overline{CS}$	Chip Select Input
SO	Serial Data Output
$\overline{WP}$	Write-Protect
Vss	Ground
SI	Serial Data Input
SCK	Serial Clock Input
$\overline{HOLD}$	Hold Input
Vcc	Supply Voltage

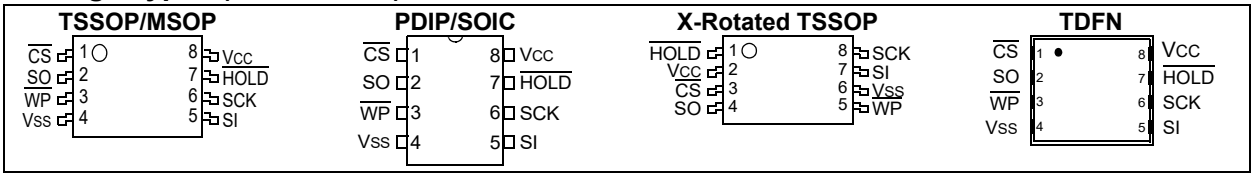
Description

The Microchip Technology Inc. 25AA320A/25LC320A (25XX320A[1]) are 32-Kbit Serial Electrically Erasable PROMs. The memory is accessed via a simple Serial Peripheral Interface (SPI) compatible serial bus. The bus signals required are a clock input (SCK) plus separate data in (SI) and data out (SO) lines. Access to the device is controlled through a Chip Select ($\overline{CS}$) input.

Communication to the device can be paused via the hold pin ($\overline{HOLD}$). While the device is paused, transitions on its inputs will be ignored, with the exception of Chip Select, allowing the host to service higher priority interrupts.

Note 1: 25XX320A is used in this document as a generic part number for the 25AA320A, 25LC320A devices.

Package Types (not to scale)



1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings(†)

VCC.....6.5V

All inputs and outputs w.r.t. VSS .....-0.6V to VCC +1.0V

Storage temperature .....-65°C to +150°C

Ambient temperature under bias.....-65°C to +125°C

ESD protection on all pins.....4 kV

† NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for an extended period of time may affect device reliability.

TABLE 1-1: DC CHARACTERISTICS

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1: PIN FUNCTION TABLE

Name	MSSOP	PDIP	SOIC	TDFN	TSSOP	X-Rotated TSSOP	Function
$\overline{CS}$	1	1	1	1	1	3	Chip Select Input
SO	2	2	2	2	2	4	Serial Data Output
$\overline{WP}$	3	3	3	3	3	5	Write-Protect Pin
VSS	4	4	4	4	4	6	Ground
SI	5	5	5	5	5	7	Serial Data Input
SCK	6	6	6	6	6	8	Serial Clock Input
$\overline{HOLD}$	7	7	7	7	7	1	Hold Input
VCC	8	8	8	8	8	2	Supply Voltage

Note 1: The exposed pad on the TDFN package can be connected to VSS or left floating.

2.1 Chip Select ($\overline{CS}$)

A low level on this pin selects the device. A high level deselects the device and forces it into Standby mode. However, a programming cycle which is already initiated or in progress will be completed, regardless of the $\overline{CS}$ input signal. If $\overline{CS}$ is brought high during a program cycle, the device will go into Standby mode as soon as the programming cycle is complete. When the device is deselected, SO goes to the high-impedance state, allowing multiple parts to share the same SPI bus. A low-to-high transition on $\overline{CS}$ after a valid write sequence initiates an internal write cycle. After power-up, a low level on $\overline{CS}$ is required prior to any sequence being initiated.

2.2 Serial Output (SO)

The SO pin is used to transfer data out of the 25XX320A. During a read cycle, data are shifted out on this pin after the falling edge of the serial clock.

2.3 Write-Protect ($\overline{WP}$)

This pin is used in conjunction with the WPEN bit in the STATUS register to prohibit writes to the nonvolatile bits in the STATUS register. When $\overline{WP}$ is low and WPEN is high, writing to the nonvolatile bits in the STATUS register is disabled. All other operations function normally. When $\overline{WP}$ is high, all functions, including writes to the nonvolatile bits in the STATUS register operate normally. If the WPEN bit is set, $\overline{WP}$ low during a STATUS register write sequence will disable writing to the STATUS register. If an internal write cycle has already begun, $\overline{WP}$ going low will have no effect on the write. The $\overline{WP}$ pin function is blocked when the WPEN bit in the STATUS register is low. This allows the user to install the 25XX320A in a system with $\overline{WP}$ pin grounded and still be able to write to the STATUS register. The $\overline{WP}$ pin functions will be enabled when the WPEN bit is set high.

2.4 Serial Input (SI)

The SI pin is used to transfer data into the device. It receives instructions, addresses and data. Data are latched on the rising edge of the serial clock.

2.5 Serial Clock (SCK)

The SCK is used to synchronize the communication between a host and the 25XX320A. Instructions, addresses or data present on the SI pin are latched on the rising edge of the clock input, while data on the SO pin is updated after the falling edge of the clock input.

2.6 Hold ($\overline{HOLD}$)

The $\overline{HOLD}$ pin is used to suspend transmission to the 25XX320A while in the middle of a serial sequence without having to retransmit the entire sequence again. It must be held high any time this function is not being used. Once the device is selected and a serial sequence is underway, the $\overline{HOLD}$ pin may be pulled low to pause further serial communication without resetting the serial sequence.

The $\overline{HOLD}$ pin must be brought low while SCK is low, otherwise the HOLD function will not be invoked until the next SCK high-to-low transition. The 25XX320A must remain selected during this sequence. The SI and SCK levels are “don’t cares” during the time the device is paused and any transitions on these pins will be ignored. To resume serial communication, $\overline{HOLD}$ must be brought high while the SCK pin is low; otherwise serial communication will not be resumed until the next SCK high-to-low transition.

The SO line will tri-state immediately upon a high-to-low transition of the HOLD pin and will begin outputting again immediately upon a subsequent low-to-high transition of the HOLD pin, independent of the state of SCK.

3.0 FUNCTIONAL DESCRIPTION

3.1 Principles of Operation

The 25XX320A is a 4096-byte Serial EEPROM designed to interface directly with the Serial Peripheral Interface (SPI) port of many of today's popular microcontroller families, including Microchip's PIC® microcontrollers. It may also interface with microcontrollers that do not have a built-in SPI port by using discrete I/O lines programmed properly in firmware to match the SPI protocol.

The 25XX320A contains an 8-bit instruction register. The device is accessed via the SI pin, with data being clocked in on the rising edge of SCK. The CS pin must be low and the HOLD pin must be high for the entire operation.

Table 3-1 contains a list of the possible instruction bytes and format for device operation. All instructions, addresses and data are transferred MSB first, LSB last.

Data (SI) are sampled on the first rising edge of SCK after CS goes low. If the clock line is shared with other peripheral devices on the SPI bus, the user can assert the HOLD input and place the 25XX320A in 'HOLD' mode. After releasing the HOLD pin, operation will resume from the point when the HOLD was asserted.

BLOCK DIAGRAM

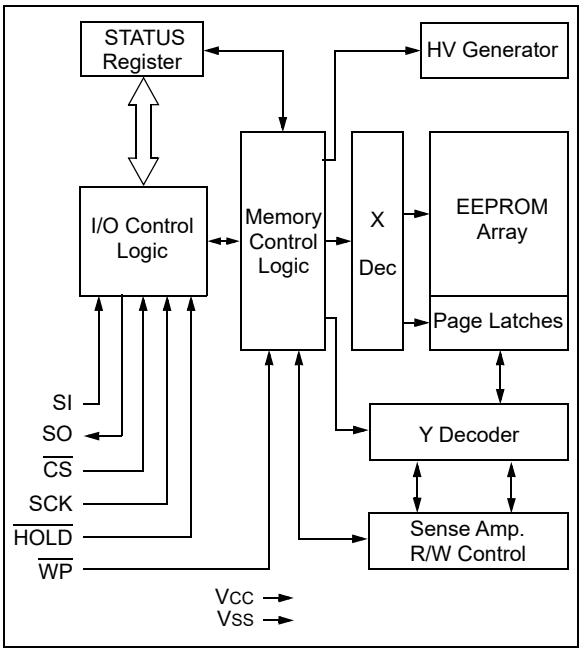

TABLE 3-1: INSTRUCTION SET

Instruction Name	Instruction Format	Description
READ	0000 0011	Read data from memory array beginning at selected address
WRITE	0000 0010	Write data to memory array beginning at selected address
WRDI	0000 0100	Reset the write enable latch (disable write operations)
WREN	0000 0110	Set the write enable latch (enable write operations)
RDSR	0000 0101	Read STATUS register
WRSR	0000 0001	Write STATUS register

3.2 Read Sequence

The device is selected by pulling $\overline{CS}$ low. The 8-bit `READ` instruction is transmitted to the 25XX320A followed by the 16-bit address, with the four MSBs of the address being “don’t care” bits. After the correct `READ` instruction and address are sent, the data stored in the memory at the selected address are shifted out on the SO pin. The data stored in the memory at the next address can be read sequentially by continuing to provide clock pulses. The internal Address Pointer is automatically incremented to the next higher address after each byte of data are shifted out. When the highest address is reached (0FFFh), the address counter rolls over to address 0000h allowing the read cycle to be continued indefinitely. The read operation is terminated by raising the $\overline{CS}$ pin (Figure 3-1).

3.3 Write Sequence

Prior to any attempt to write data to the 25XX320A, the write enable latch must be set by issuing the `WREN` instruction (Figure 3-4). This is done by setting $\overline{CS}$ low and then clocking out the proper instruction into the 25XX320A. After all eight bits of the instruction are transmitted, the $\overline{CS}$ must be brought high to set the write enable latch. If the write operation is initiated immediately after the `WREN` instruction without $\overline{CS}$ being brought high, the data will not be written to the array because the write enable latch will not have been properly set.

Once the write enable latch is set, the user may proceed by setting the $\overline{CS}$ low, issuing a `WRITE` instruction, followed by the 16-bit address, with the four MSBs of the address being “don’t care” bits, and then the data to be written. Up to 32 bytes of data can be sent to the device before a write cycle is necessary. The only restriction is that all of the bytes must reside in the same page.

Note:	Page write operations are limited to writing bytes within a single physical page, **regardless** of the number of bytes actually being written. Physical page boundaries start at addresses that are integer multiples of the page buffer size (or ‘page size’) and end at addresses that are integer multiples of page size – 1. If a Page Write command attempts to write across a physical page boundary, the result is that the data wrap around to the beginning of the current page (overwriting data previously stored there), instead of being written to the next page as might be expected. It is therefore necessary for the application software to prevent page write operations that would attempt to cross a page boundary.

For the data to be actually written to the array, the $\overline{CS}$ must be brought high after the Least Significant bit (D0) of the n^{th} data byte has been clocked in. If $\overline{CS}$ is brought high at any other time, the write operation will not be completed. Refer to Figure 3-2 and Figure 3-3 for more detailed illustrations on the byte write sequence and the page write sequence, respectively. While the write is in progress, the STATUS register may be read to check the status of the WPEN, WIP, WEL, BP1 and BP0 bits (Figure 3-6). A read attempt of a memory array location will not be possible during a write cycle. When the write cycle is completed, the write enable latch is reset.

FIGURE 3-1: READ SEQUENCE

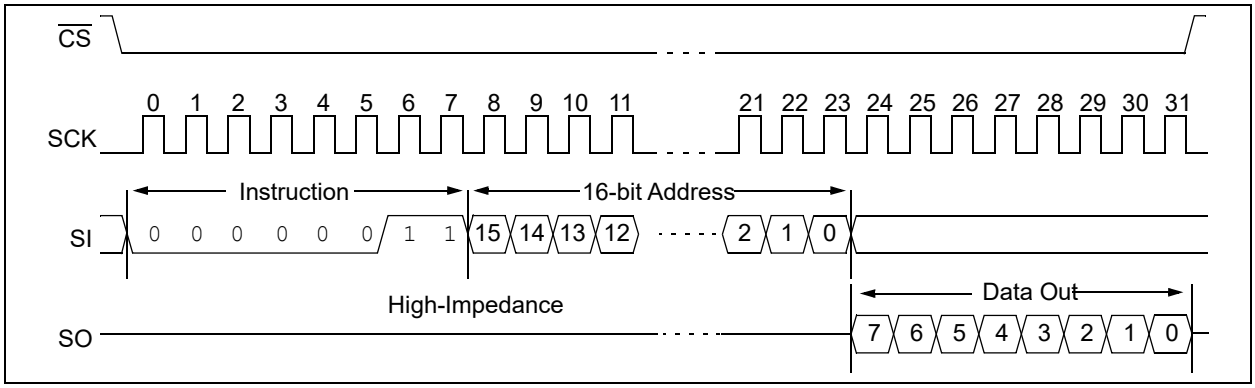

FIGURE 3-2: BYTE WRITE SEQUENCE

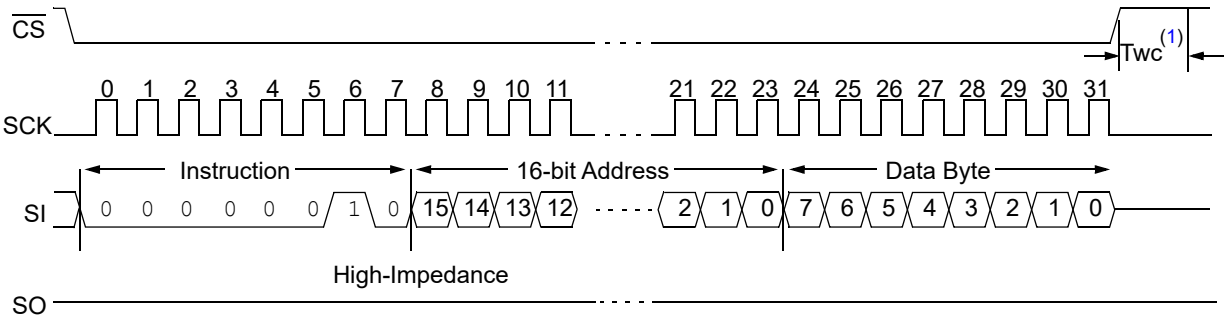
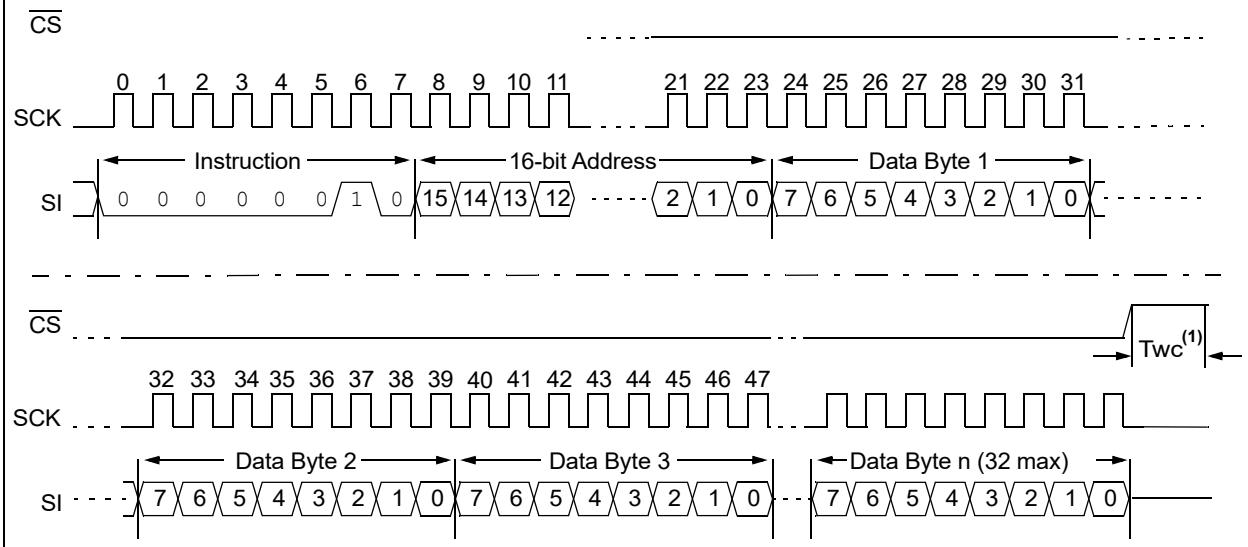


Note 1: This sequence initiates a self-timed internal write cycle on the rising edge of $\overline{CS}$ after a valid sequence.

FIGURE 3-3: PAGE WRITE SEQUENCE



Note 1: This sequence initiates a self-timed internal write cycle on the rising edge of CS after a valid sequence.

3.4 Write Enable (WREN) and Write Disable (WRDI)

The 25XX320A contains a write enable latch. See Table 3-4 for the write-protect functionality matrix. This latch must be set before any write operation will be completed internally. The WREN instruction will set the latch, and the WRDI will reset the latch.

The following is a list of conditions under which the write enable latch will be reset:

- Power-up
- WRDI instruction successfully executed
- WRSR instruction successfully executed
- WRITE instruction successfully executed

FIGURE 3-4: WRITE ENABLE SEQUENCE (WREN)

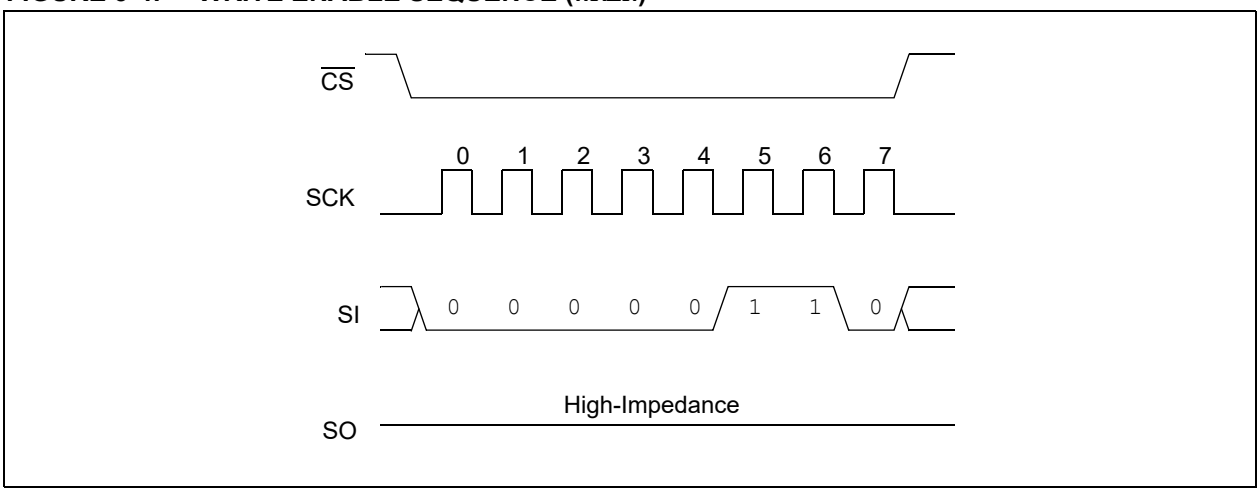


FIGURE 3-5: WRITE DISABLE SEQUENCE (WRDI)

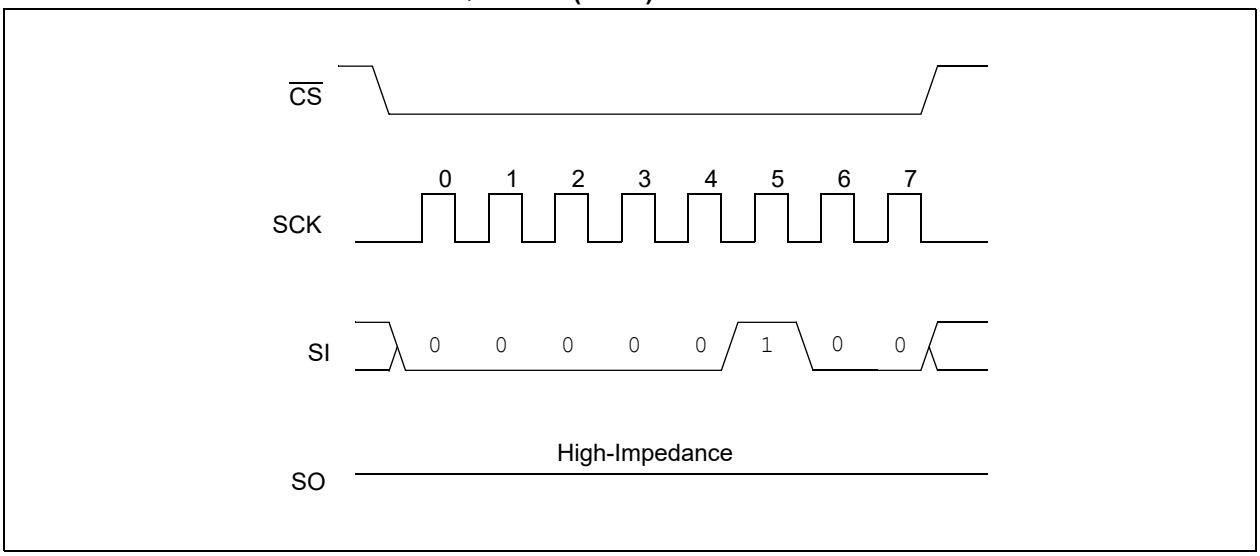


3.5 Read STATUS Register Instruction (RDSR)

The Read STATUS Register instruction (RDSR) provides access to the STATUS register. The STATUS register may be read at any time, even during a write cycle. The STATUS register is formatted as follows:

TABLE 3-2: STATUS REGISTER

7	6	5	4	3	2	1	0
W/R	–	–	–	W/R	W/R	R	R
WPEN	X	X	X	BP1	BP0	WEL	WIP

Note 1: W/R = writable/readable. R = read-only.

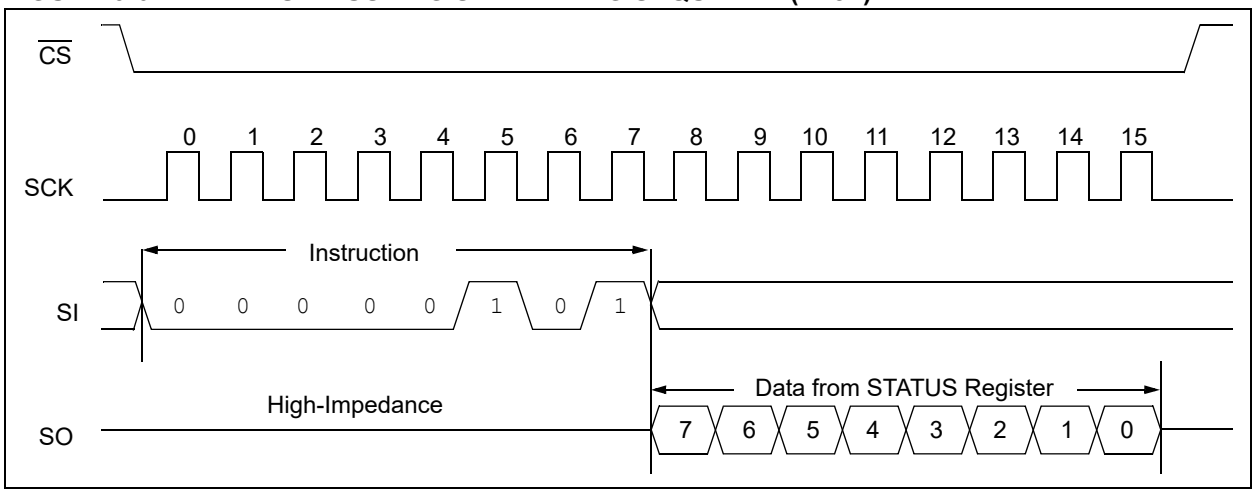
The **Write-In-Process (WIP)** bit indicates whether the 25XX320A is busy with a write operation. When set to a '1', a write is in progress, when set to a '0', no write is in progress. This bit is read-only.

The **Write Enable Latch (WEL)** bit indicates the status of the write enable latch and is read-only. When set to a '1', the latch allows writes to the array, when set to a '0', the latch prohibits writes to the array. The state of this bit can always be updated via the WREN or WRDI commands, regardless of the state of write protection on the STATUS register. These commands are shown in Figure 3-4 and Table 3-5.

The **Block Protection (BP0 and BP1)** bits indicate which blocks are currently write-protected. These bits are set by the user issuing the WRSR instruction. These bits are nonvolatile and are shown in Table 3-3.

See Figure 3-6 for the RDSR timing sequence.

FIGURE 3-6: READ STATUS REGISTER TIMING SEQUENCE (RDSR)



3.6 Write STATUS Register Instruction (WRSR)

The Write STATUS Register instruction (WRSR) allows the user to write to the nonvolatile bits in the STATUS register as shown in Table 3-2. The user is able to select one of four levels of protection for the array by writing to the appropriate bits in the STATUS register. The array is divided up into four segments. The user has the ability to write-protect none, one, two or all four of the segments of the array. The partitioning is controlled as shown in Table 3-3.

The Write-Protect Enable (WPEN) bit is a nonvolatile bit that is available as an enable bit for the $\overline{WP}$ pin. The Write-Protect ($\overline{WP}$) pin and the Write-Protect Enable (WPEN) bit in the STATUS register control the programmable hardware write-protect feature. Hardware write protection is enabled when $\overline{WP}$ pin is low and the WPEN bit is high. Hardware write protection is disabled when either the $\overline{WP}$ pin is high or the WPEN bit is low. When the chip is hardware write-protected, only writes to nonvolatile bits in the STATUS register are disabled. See Table 3-4 for a matrix of functionality on the WPEN bit.

See Figure 3-7 for the WRSR timing sequence.

TABLE 3-3: ARRAY PROTECTION

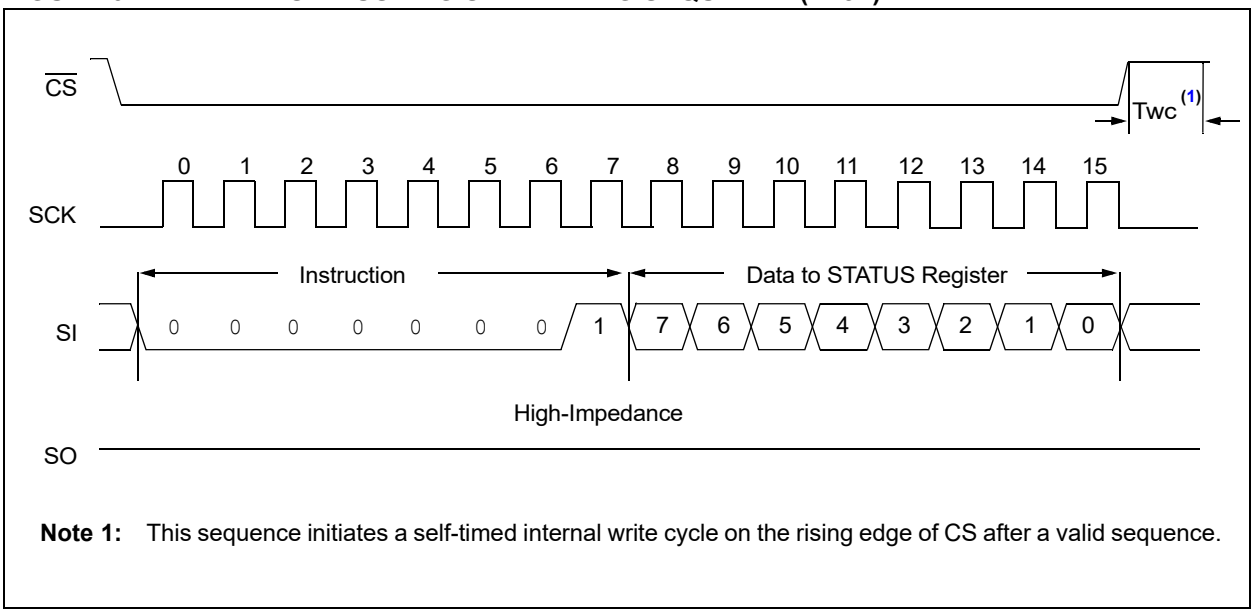
BP1	BP0	Array Addresses Write-Protected
0	0	none
0	1	upper 1/4 (0C00h-0FFFh)
1	0	upper 1/2 (0800h-0FFFh)
1	1	all (0000h-0FFFh)

TABLE 3-4: WRITE-PROTECT FUNCTIONALITY MATRIX

WEL (SR bit 1)	WPEN (SR bit 7)	$\overline{WP}$ (pin 3)	Protected Blocks	Unprotected Blocks	STATUS Register
0	x	x	Protected	Protected	Protected
1	0	x	Protected	Writable	Writable
1	1	0 (low)	Protected	Writable	Protected
1	1	1 (high)	Protected	Writable	Writable

Note 1: x = don't care

FIGURE 3-7: WRITE STATUS REGISTER TIMING SEQUENCE (WRSR)



Note 1: This sequence initiates a self-timed internal write cycle on the rising edge of CS after a valid sequence.

4.0 DATA PROTECTION

The following protection has been implemented to prevent inadvertent writes to the array:

- The write enable latch is reset on power-up
- A write enable instruction must be issued to set the write enable latch
- After a byte write, page write or STATUS register write, the write enable latch is reset
- $\overline{CS}$ must be set high after the proper number of clock cycles to start an internal write cycle
- Access to the array during an internal write cycle is ignored and programming is continued

5.0 POWER-ON STATE

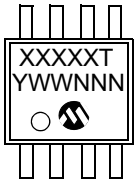
The 25XX320A powers on in the following state:

- The device is in low-power Standby mode ($\overline{CS}$ = 1)
- The write enable latch is reset
- SO is in high-impedance state
- A high-to-low-level transition on $\overline{CS}$ is required to enter active state

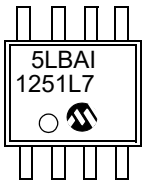
6.0 PACKAGING INFORMATION

6.1 Package Marking Information

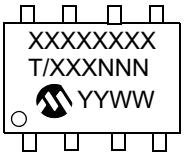
8-Lead MSOP (150 mil)



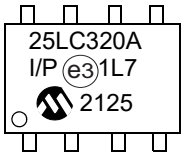
Example:



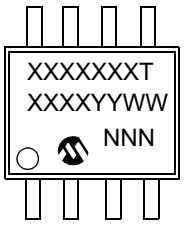
8-Lead PDIP



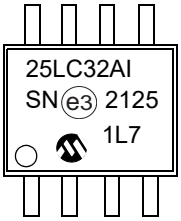
Example:



8-Lead SOIC

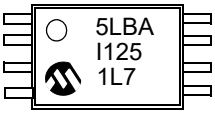


Example:

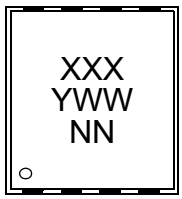


8-Lead TSSOP

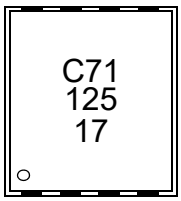
Example:



8-Lead 2x3 TDFN



Example:



1st Line Marking Codes						
Part Number	MSOP	SOIC	TSSOP	Rotated TSSOP	TDFN	
					I Temp.	E Temp.
25AA320A	5ABAT	25AA32AT	5ABA	LBAX	C71	—
25LC320A	5LBAT	25LC32AT	5LBA	LBAX	C74	C75

Legend:	XX...X	Customer-specific information
	T	Temperature grade (I, E)
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week ‘01’)
	NNN	Alphanumeric traceability code
	(e3)	RoHS-compliant JEDEC® designator for Matte Tin (Sn)

Note: For very small packages with no room for the RoHS-compliant JEDEC® designator (e3), the marking will only appear on the outer carton or reel label.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

Microchip Technology Drawing C04-2086 Rev B

APPENDIX A: REVISION HISTORY

Revision H (09/21)

Added Automotive Product ID page; Reformatted some sections for better readability; Updated PDIP, SOIC and TSSOP package drawings.

Revision G (08/18)

Consolidated marking codes into a single Line Marking table.

Revision F (06/09)

Added X-Rotated TSSOP to package types; Revised Table 1-2, Param. 21; Revised Table 3-1; Revised TSSOP Line Marking table; Revised Product ID section.

Revision E (10/08)

Added TDFN Package; Revised Table 3-1, Pin Function Table; Updated Package Drawings.

Revision D (03/07)

Replaced Package Drawings (Rev. AM).

Revision C (02/07)

Deleted X-Rotated TSSOP; Revised Table 1-3; Revised Packaging Information; Replaced Package Drawings; Revised Product ID System.

Revision B

Corrections to Section 1.0, Electrical Characteristics.

THE MICROCHIP WEBSITE

Microchip provides online support via our website at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the website at: http://microchip.com/support

PRODUCT IDENTIFICATION SYSTEM (NON-AUTOMOTIVE)

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X [1]	-X	/XX
Device	Tape and Reel	Temperature Range	Package

Device:	25AA320A	= 32k-bit, 1.8V, SPI Serial EEPROM
	25LC320A	= 32k-bit, 2.5V, SPI Serial EEPROM
	25AA320AX	= 32k-bit, 1.8V, SPI Serial EEPROM in rotated pinout (ST only)
	25LC320AX	= 32k-bit, 2.5V, SPI Serial EEPROM in rotated pinout (ST only)
Tape and Reel:	Blank	= Standard packaging
	T	= Tape and Reel [1]
Temperature Range:	I	= -40°C to +85°C (Industrial)
	E	= -40°C to +125°C (Extended)
Package:	MS	= Plastic Micro Small Outline – 8-lead (MSOP)
	P	= Plastic Dual In-Line – 300 mil Body, 8-lead (PDIP)
	SN	= Plastic Small Outline - Narrow, 3.90 mm Body, 8-lead (SOIC)
	ST	= Plastic Thin Shrink Small Outline – 4.4 mm, 8-lead (TSSOP)
	MNY [1]	= Plastic Dual Flat, No Lead - 2x3x0.8 mm Body, 8-lead (TDFN)

Examples:

a) 25AA320A-I/MS = 32k-bit, 1.8V Serial EEPROM, Industrial temperature, MSOP package

b) 25AA320AT-I/SN = 32k-bit, 1.8V Serial EEPROM, Industrial temperature, Tape and Reel, SOIC package

c) 25LC320AT-E/SN = 32k-bit, 2.5V Serial EEPROM, Extended temperature, Tape and Reel, SOIC package

d) 25LC320AT-I/ST = 32k-bit, 2.5V Serial EEPROM, Industrial temperature, Tape and Reel, TSSOP package

e) 25LC320AXT-I/ST = 32k-bit, 2.5V Serial EEPROM, Industrial temperature, Tape and Reel, Rotated pinout, TSSOP package

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

2: “Y” indicates a Nickel Palladium Gold (NiPdAu) finish.

PRODUCT IDENTIFICATION SYSTEM (AUTOMOTIVE)

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X [1]	-X	/XX	XXX [2, 3]
Device	Tape and Reel	Temperature Range	Package	Variant

Device:	25AA320A = 32k-bit, 1.8V, SPI Serial EEPROM 25LC320A = 32k-bit, 2.5V, SPI Serial EEPROM	
Tape and Reel:	Blank = Standard packaging T = Tape and Reel [1]	
Temperature Range:	I = -40°C to+85°C (AEC-Q100 Grade 3) E = -40°C to+125°C (AEC-Q100 Grade 1)	
Package:	MS = Plastic Micro Small Outline – 8-lead (MSOP) SN = Plastic Small Outline - Narrow, 3.90 mm Body, 8-lead (SOIC) ST = Plastic Thin Shrink Small Outline – 4.4 mm, 8-lead (TSSOP) MNY [4] = Plastic Dual Flat, No Lead - 2x3x0.8 mm Body, 8-lead (TDFN)	
Variant [2, 3]	16KVAO = Standard Automotive, 16K Process 16KVXX = Customer-Specific Automotive, 16K Process	

Examples:

a) 25LC320AT-I/ST16KVAO = 32k-bit, 2.5V Serial EEPROM, Automotive Grade 3, Tape and Reel, TSSOP package

b) 25LC320AT-I/MNY16KVAO = 32k-bit, 2.5V Serial EEPROM, Automotive Grade 3, Tape and Reel, TDFN package

c) 25LC320A-E/SN16KVAO = 32k-bit, 2.5V, Serial EEPROM, Automotive Grade 1, SOIC package

d) 25LC320AT-E/SN16KVAO = 32k-bit, 2.5V, Serial EEPROM, Automotive Grade 1, Tape and Reel, SOIC package

e) 25LC320A-E/ST16KVAO = 32K-bit, 2.5V, Serial EEPROM, Automotive Grade 1, TSSOP package

f) 25LC320AT-E/ST16KVAO = 32K-bit, 2.5V, Serial EEPROM, Automotive Grade 1, Tape and Reel, TSSOP package

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.

2: The VAO/VXX automotive variants have been designed, manufactured, tested and qualified in accordance with AEC-Q100 requirements for automotive applications.

3: For customers requesting a PPAP, a customer- specific part number will be generated and provided. A PPAP is not provided for VAO part numbers.

4: “Y” indicates a Nickel Palladium Gold (NiPdAu) finish.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
