## Functional Description

CY7C1061G and CY7C1061GE are high-performance CMOS fast static RAM devices with embedded ECC<sup>[1]</sup>. Both devices are offered in single and dual chip enable options and in multiple pin configurations. The CY7C1061GE device includes an ERR pin that signals a single-bit error-detection and correction event during a read cycle.

To access devices with a single chip enable input, assert the chip enable ( $\overline{CE}$ ) input LOW. To access dual chip enable devices, assert both chip enable inputs –  $\overline{CE}_1$  as LOW and  $\overline{CE}_2$  as HIGH.

To perform data writes, assert the Write Enable ( $\overline{WE}$ ) input LOW, and provide the data and address on the device data pins ( $I/O_0$  through  $I/O_{15}$ ) and address pins ( $A_0$  through  $A_{19}$ ) respectively. The Byte High Enable ( $\overline{BHE}$ ) and Byte Low Enable ( $\overline{BLE}$ ) inputs control byte writes, and write data on the corresponding I/O lines to the memory location specified.  $\overline{BHE}$  controls  $I/O_8$  through  $I/O_{15}$  and  $\overline{BLE}$  controls  $I/O_0$  through  $I/O_7$ .

To perform data reads, assert the Output Enable ( $\overline{OE}$ ) input and provide the required address on the address lines. Read data is accessible on I/O lines ( $I/O_0$  through  $I/O_{15}$ ). You can perform byte accesses by asserting the required byte enable signal ( $\overline{BHE}$  or  $\overline{BLE}$ ) to read either the upper byte or the lower byte of data from the specified address location.

All I/Os ( $I/O_0$  through  $I/O_{15}$ ) are placed in a high-impedance state when the device is deselected ( $\overline{CE}$  HIGH for a single chip enable device and  $\overline{CE}_1$  HIGH /  $\overline{CE}_2$  LOW for a dual chip enable device), or control signals are de-asserted ( $\overline{OE}$ ,  $\overline{BLE}$ ,  $\overline{BHE}$ ).

On the CY7C1061GE devices, the detection and correction of a single-bit error in the accessed location is indicated by the assertion of the ERR output (ERR = High). See the [Truth Table on page 16](#) for a complete description of read and write modes.

The logic block diagrams are on page 2.

The CY7C1061G and CY7C1061GE devices are available in 48-pin TSOP I, 54-pin TSOP II, and 48-ball VFBGA packages.

### Notes

9.  $V_{IL(\text{min})} = -2.0$  V and  $V_{IH(\text{max})} = V_{CC} + 2$  V for pulse durations of less than 20 ns.

10. Typical values are included only for reference and are not guaranteed or tested. Typical values are measured at  $V_{CC} = 1.8$  V (for a  $V_{CC}$  range of 1.65 V–2.2 V),  $V_{CC} = 3$  V (for a  $V_{CC}$  range of 2.2 V–3.6 V), and  $V_{CC} = 5$  V (for a  $V_{CC}$  range of 4.5 V–5.5 V),  $T_A = 25$  °C.

11. This parameter is guaranteed by design and is not tested.

12. For all dual chip enable devices,  $\overline{CE}$  is the logical combination of  $\overline{CE}_1$  and  $CE_2$ . When  $\overline{CE}_1$  is LOW and  $CE_2$  is HIGH,  $\overline{CE}$  is LOW; when  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW,  $\overline{CE}$  is HIGH.

### Notes

18. Test conditions assume signal transition time (rise/fall) of 3 ns or less, timing reference levels of 1.5 V (for  $V_{\text{CC}} \geq 3\text{ V}$ ) and  $V_{\text{CC}}/2$  (for  $V_{\text{CC}} < 3\text{ V}$ ), and input pulse levels of 0 to 3 V (for  $V_{\text{CC}} \geq 3\text{ V}$ ) and 0 to  $V_{\text{CC}}$  (for  $V_{\text{CC}} < 3\text{ V}$ ). Test conditions for the read cycle use the output loading, shown in part (a) of [Figure 11 on page 8](#), unless specified otherwise.
19.  $t_{\text{POWER}}$  gives the minimum amount of time that the power supply is at stable  $V_{\text{CC}}$  until the first memory access is performed.
20. These parameters are guaranteed by design and are not tested.
21. For all dual chip enable devices,  $\overline{\text{CE}}$  is the logical combination of  $\overline{\text{CE}}_1$  and  $\text{CE}_2$ . When  $\overline{\text{CE}}_1$  is LOW and  $\text{CE}_2$  is HIGH,  $\overline{\text{CE}}$  is LOW; when  $\overline{\text{CE}}_1$  is HIGH or  $\text{CE}_2$  is LOW,  $\overline{\text{CE}}$  is HIGH.
22.  $t_{\text{HZOE}}$ ,  $t_{\text{HZCE}}$ ,  $t_{\text{HZWE}}$ , and  $t_{\text{HZBE}}$  are specified with a load capacitance of 5 pF, as shown in part (b) of [Figure 11 on page 8](#). Hi-Z, Lo-Z transition is measured  $\pm 200\text{ mV}$  from steady state voltage.
23. At any temperature and voltage condition,  $t_{\text{HZCE}}$  is less than  $t_{\text{LZCE}}$ ,  $t_{\text{HZBE}}$  is less than  $t_{\text{LZBE}}$ ,  $t_{\text{HZOE}}$  is less than  $t_{\text{LZOE}}$ , and  $t_{\text{HZWE}}$  is less than  $t_{\text{LZWE}}$  for any device.
24. Tested initially and after any design or process changes that may affect these parameters.
25. The internal write time of the memory is defined by the overlap of  $\overline{\text{WE}} = V_{\text{IL}}$ ,  $\overline{\text{CE}} = V_{\text{IL}}$ , and  $\overline{\text{BHE}}$  or  $\overline{\text{BLE}} = V_{\text{IL}}$ . These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
26. The minimum write pulse width for Write Cycle No. 2 ( $\overline{\text{WE}}$  Controlled,  $\overline{\text{OE}}$  LOW) should be sum of  $t_{\text{HZWE}}$  and  $t_{\text{SD}}$ .

**Notes**

- 27. The device is continuously selected,  $\overline{OE} = V_{IL}$ ,  $\overline{CE} = V_{IL}$ ,  $\overline{BHE}$  or  $\overline{BLE}$  or both =  $V_{IL}$ .
- 28.  $\overline{WE}$  is HIGH for read cycle.

Switching Waveforms (continued)

Notes

- 29. For all dual chip enable devices,  $\overline{\text{CE}}$  is the logical combination of  $\overline{\text{CE}}_1$  and  $\text{CE}_2$ . When  $\overline{\text{CE}}_1$  is LOW and  $\text{CE}_2$  is HIGH,  $\overline{\text{CE}}$  is LOW; when  $\overline{\text{CE}}_1$  is HIGH or  $\text{CE}_2$  is LOW,  $\overline{\text{CE}}$  is HIGH.
- 30.  $\overline{\text{WE}}$  is HIGH for read cycle.
- 31. Address valid prior to or coincident with  $\overline{\text{CE}}$  LOW transition.

**Figure 17. Write Cycle No. 2 ( $\overline{WE}$  Controlled,  $\overline{OE}$  LOW)** [32, 33, 34, 35]

**Notes**

32. For all dual chip enable devices,  $\overline{CE}$  is the logical combination of  $\overline{CE}_1$  and  $CE_2$ . When  $\overline{CE}_1$  is LOW and  $CE_2$  is HIGH,  $\overline{CE}$  is LOW; when  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW,  $\overline{CE}$  is HIGH.
33. The internal write time of the memory is defined by the overlap of  $\overline{WE} = V_{IL}$ ,  $\overline{CE} = V_{IL}$  and  $\overline{BHE}$  or  $\overline{BLE} = V_{IL}$ . These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
34. Data I/O is in high-impedance state if  $\overline{CE} = V_{IH}$ , or  $\overline{OE} = V_{IH}$  or  $\overline{BHE}$ , and/or  $\overline{BLE} = V_{IH}$ .
35. The minimum write cycle pulse width should be equal to sum of  $t_{HZWE}$  and  $t_{SD}$ .
36. During this period the I/Os are in output state. Do not apply input signals.

Figure 18. Write Cycle No. 3 ( $\overline{WE}$  Controlled) [37, 38, 39]

Notes

- 37. For all dual chip enable devices,  $\overline{CE}$  is the logical combination of  $\overline{CE}_1$  and  $CE_2$ . When  $\overline{CE}_1$  is LOW and  $CE_2$  is HIGH,  $\overline{CE}$  is LOW; when  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW,  $\overline{CE}$  is HIGH.
- 38. The internal write time of the memory is defined by the overlap of  $\overline{WE} = V_{IL}$ ,  $\overline{CE} = V_{IL}$  and  $\overline{BHE}$  or  $\overline{BLE} = V_{IL}$ . These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
- 39. Data I/O is in high-impedance state if  $\overline{CE} = V_{IH}$ , or  $\overline{OE} = V_{IH}$  or  $\overline{BHE}$ , and/or  $\overline{BLE} = V_{IH}$ .
- 40. During this period, the I/Os are in output state. Do not apply input signals.

**Notes**

41. For all dual chip enable devices,  $\overline{CE}$  is the logical combination of  $\overline{CE}_1$  and  $CE_2$ . When  $\overline{CE}_1$  is LOW and  $CE_2$  is HIGH,  $\overline{CE}$  is LOW; when  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW,  $\overline{CE}$  is HIGH.
42. The internal write time of the memory is defined by the overlap of  $\overline{WE} = V_{IL}$ ,  $\overline{CE} = V_{IL}$  and  $\overline{BHE}$  or  $\overline{BLE} = V_{IL}$ . These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
43. Data I/O is in high-impedance state if  $\overline{CE} = V_{IH}$ , or  $\overline{OE} = V_{IH}$  or  $\overline{BHE}$ , and/or  $\overline{BLE} = V_{IH}$ .
44. During this period, the I/Os are in output state. Do not apply input signals.

**Notes**

45. For all dual chip enable devices,  $\overline{CE}$  is the logical combination of  $\overline{CE}_1$  and  $CE_2$ . When  $\overline{CE}_1$  is LOW and  $CE_2$  is HIGH,  $\overline{CE}$  is LOW; when  $\overline{CE}_1$  is HIGH or  $CE_2$  is LOW,  $\overline{CE}$  is HIGH.

46. The input voltage levels on these pins should be either at  $V_{IH}$  or  $V_{IL}$ .

47. ERR is an Output pin. If not used, this pin should be left floating.
