

QUICK START GUIDE FOR DEMONSTRATION CIRCUIT 773

SYNCHRONOUS 1MHZ LUXEON III WHITE LED DRIVER

LTC3441 & LTC2050

DESCRIPTION

Demonstration circuit 773 is a synchronous buck-boost 1MHz Luxeon III white LED driver featuring the LTC3441 and LTC2050. The board is optimized for 3.9V LED forward voltage output at 1000mA load current and a single lithium-ion input voltage range of 3V to 4.2V. With its high frequency, synchronous buck-boost internal power switches, low quiescent current, 1MHz switching frequency and thermally enhanced package, the LTC3441 is a very versatile and powerful IC for driving Luxeon III LEDs that require both step-up and step-down capability from lithium-ion supplies used in very compact handheld solutions.

The LTC3441 1MHz switching frequency allows all of the components to be small, surface mount devices. The current-mode control topology creates fast transient response and good loop stability with a minimum number of external components. The LED pushbutton is used to manually turn on the LED. The $\overline{\text{SHDN}}$ terminal can be used to program pulses of light from an external source for certain flash applications. The DIM terminal can be used to program the LED for dimmer operation than 1A LED current using a external PWM signal. The

optional MODE/SYNC terminal can be used to synchronize the LTC3441 clock with an external clock.

The LTC2050 is used to control a constant LED current at the output with the minimum amount of power dissipation in the sense resistor. The five-pin LTC2050IS5 is used for minimum components and minimum pins, but the LTC2050IS6 with a shutdown pin can be used for extremely low quiescent current. [1]

The LTC3441 and LTC2050 datasheets give complete descriptions of the parts including operation and applications information. The datasheets must be read in conjunction with this Quick Start Guide for demonstration circuit 773. The LTC3441 is assembled in a small 10-pin thermally enhanced package with exposed pad. Lumileds' LXHL-PW09 Luxeon III LED emitter has an exposed pad slug for thermal enhancement. Proper board layout is essential for maximum thermal performance. The LXHL-PW09 datasheet is found on Lumileds website www.lumileds.com.

Design files for this circuit board are available. Call the LTC factory.

Table 1. Typical Performance Summary ($T_A = 25^\circ\text{C}$)

PARAMETER	CONDITION	VALUE
Input Voltage Range		3–4.2V
LED OFF Input Current [1]	$V_{IN} = 3.6\text{V}$, U2 LTC2050IS6 w/ Shutdown [1]	1.4 μA
	$V_{IN} = 3.6\text{V}$, U2 LTC2050IS5 w/out Shutdown [1]	1.08mA
V_{LED}	$V_{IN} = 3\text{V}$ to 4.2V, LED ON, $I_{LED} = 1000\text{mA}$	3.9V
I_{LED}	$V_{IN} = 3\text{V}$ to 4.2V, LED ON	1000mA
LED Ripple Current	$V_{IN} = 3.6\text{V}$, LED ON, $I_{OUT} = 1000\text{mA}$	25mA _{PK-PK}
Switching Frequency	$V_{IN} = 3\text{V}$ to 4.2V, LED ON	1MHz
Efficiency	$V_{IN} = 3.6\text{V}$, $I_{LED} = 1000\text{mA}$, LED ON	84%
LED Brightness	$V_{IN} = 3.6\text{V}$, $I_{LED} = 1000\text{mA}$, LED ON	80LM

NOTE: [1] Replace LTC2050IS5 with LTC2050IS6 for low quiescent current during LED OFF. Tie $\overline{\text{SHDN}}$ pin of LTC2050IS6 to $\overline{\text{SHDN}}$ pin of LTC3441. DC773A is stuffed with LTC2050IS5 without a shutdown pin.

QUICK START PROCEDURE

Demonstration circuit 773 is easy to set up to evaluate the performance of the LTC3441 & LTC2050. Refer to Figure 1 for proper measurement equipment setup and follow the procedure below:

NOTE: Make sure that the input voltage does not exceed 4.2V.

NOTE: The shutdown function, dim function, and sync function are optional and their terminals can be left floating (disconnected) if not being used.

1. Connect the power supply (with power off), load, and meters as shown in Figure 1.
2. After all connections are made, turn on input power and verify that the LED turns on when the LED ON button is depressed.

NOTE: If the LED is not bright or not on, make sure that the current limit on the supply is not set too low.

3. Once the operation of the LED is established, adjust the supply within the operating range and observe the LED brightness, LED ripple, efficiency and other parameters.

Figure 1. Proper Measurement Equipment Setup

OPTIONAL FUNCTIONS

SHUTDOWN / SOFT-START

The LED ON pushbutton is used to manually demonstrate how bright the LXHL-PW09 LED is with 1000mA of LED current. However, for some flash applications, a timed pulse is required. The SHDN terminal is used to attach an external pulsed source to drive the LED at 1000mA without pressing the LED ON pushbutton.

Please see the LTC3441 datasheet for the soft-start function and its implementation using the SHDN/SS terminal.

DIM

Demonstration Circuit 773 has a DIM terminal for dimming the LED. Typically the LED provides 80LM with 1A constant current. However, for less current, the DIM function may be used by switching in a lower resistance in the feedback path. Figure 2 demonstrates where to add the parallel dimming resistor. For 50% dimming,

QUICK START GUIDE FOR DEMONSTRATION CIRCUIT 773

SYNCHRONOUS 1MHZ LUXEON III WHITE LED DRIVER

use a 10.0k resistor for RDIM. The scale of LED current versus the parallel impedance of RFB1 and RDIM is fairly proportional.

Figure 2. Implementation of the DIM function for lower LED current.

MODE / SYNCHRONIZATION OPTION

Burst mode is not used for the high current LED driver since the two states of the driver are high load current and shutdown. The Mode/Sync pin is tied to ground through the pads of R4 on the PCB. For use of the Mode/Sync functions, this connection to ground must be cut with an Exacto knife (cut the trace connected pins 1 and 2 of R4). Once the trace has been cut, the Mode/Sync pin can be reconnected to ground using a zero ohm resistor in R4 to disable its function.

The board can be externally synchronized between 1.15MHz and 1.7MHz using a synchronization signal twice the frequency of the desired switching frequency in the range of 2.3MHz to 3.4MHz. Please see the LTC3441 datasheet for details. For external synchronization, the connection to ground from the Mode/Sync pin must be severed as described above and R4 must be left unstuffed.
