MAX77643 Evaluation Kit

Evaluates: MAX77643

General Description

The MAX77643 evaluation kit (EV kit) allows for easy experimentation with various MAX77643 features, including the SIMO buck-boost regulator, linear regulators, on/off controller, and I²C interface.

The Windows[®]-based software provides a user-friendly graphical interface as well as a detailed register-based interface to exercise the features of the MAX77643.

Ordering Information appears at end of data sheet.

Benefits and Features

- Easy to use
- GUI-Driven I²C Interface
- GPIO LEDs
- Assembled and Fully Tested
- On-Board Electronic Loads
 - Steady-State, Transient, and Random Modes
- Evaluation of Push-Button and Slide-Switch On-Key Options

MAX77643_SOLDERDOWN_EVKIT_REVA_PCB_2019-10-31.pdf	Layout

Quick Start

Follow this procedure to become familiar with the EV kit.

Note: In the following sections, software-related items are identified by bolding. Text in **bold and underlined** refers to items directly from the EV kit software. Text in *italics and underlined* refers to items from the Windows operating system.

Required Equipment

- MAX77643 EV Kit
- MAX77643 EV Kit GUI
- Windows-Based PC
- Power Supply
- Ammeter
- DVM
- Micro-USB Cable

Procedure

- 1) Install the GUI software. Visit the product webpage at <http://www.maximintegrated.com/MAX-77643evkit> and navigate to Design Resources to download the latest version of the EV kit software. Save the EV kit software to a temporary folder and extract the files from the ZIP file.
- 2) Install EV kit shunts according to [Table 1](#).
- 3) Connect a Micro-B USB cable between the EV kit USB port labelled “GUI” and the Windows-based PC.
- 4) Apply a 3.7V supply (set for 100mA current limit) through an ammeter (set for 10mA range) across the V_{BATT} and GND2 terminals of the EV kit. Turn the supply on.
- 5) Open the GUI and select **Device**→**Connect** in the upper-left corner. Wait for a **CONNECTED DEVICE LIST** window to pop up, and then press the **Connect** button.
- 6) Press the on-key (SW1).
- 7) Measure SBB0, SBB1, and SBB2 with a voltmeter to ensure that the device is on.

This concludes the Quick Start procedure. Users are encouraged to explore the device and its register settings with the GUI. For guidance on configuring the GPIOs, see the [GPIO Quick Start](#) section. During general device evaluation, set the ammeter range to greater than or equal to 1A to minimize the impact of its series resistance.

For more information on the GUI, see the Software section.

Table 1. Default Shunt Positions and Jumper Descriptions

REFERENCE DESIGNATOR	DEFAULT POSITION	FUNCTION
J3	1-2	1-2: Connects nEN to SW1 (Push-button). 2-3: Connects nEN to SW2 (Slide-switch).
J4	1-2	1-2: Connects INLDO to SBB0.
J5	3-4	1-2: Connects GPIO0 to V _{IO} . 3-4: Connects GPIO0 to GUI GPIO0 (See the GPIO Quick Start section for more details) 5-6: Connects GPIO0 to ground.
J8	3-4	1-2: Connects GPIO1 to V _{IO} . 3-4: Connects GPIO1 to GUI GPIO0 (See the GPIO Quick Start section for more details) 5-6: Connects GPIO1 to ground.
J6	1-2	1-2: Connects V _{IO} pin to V _{IO} .
J7	1-2	1-2: Connects NIRQ's open drain output to V _{IO} through a 100kΩ pullup resistor.
J9	1-2	1-2: Connects NRST's open drain output to V _{IO} through a 10kΩ pullup resistor.
J10	2-3	1-2: Connects V _{IO} to an on-board 3.3V LDO (used for 3.3V logic). 2-3: Connects V _{IO} to an on-board 1.8V LDO (used for 1.8V logic).
J11	1-2	1-2: Connects SCL to the on-board FT2232 UART through the MAX3395 level shifter.
J12	1-2	1-2: Connects SDA to the on-board FT2232 UART through the MAX3395 level shifter
J201	1-2	1-2: Connects SBB0 to the on-board electronic load.

Table 1. Default Shunt Positions and Jumper Descriptions

REFERENCE DESIGNATOR	DEFAULT POSITION	FUNCTION
J203	1-2	1-2: Connects SBB1 to the on-board electronic load.
J205	1-2	1-2: Connects SBB2 to the on-board electronic load.
J207	1-2	1-2: Connects LDO to the on-board electronic load.
J200	1-2	1-2: Connects the gate of the Q200 load FET to the U200 amplifier.
J202	1-2	1-2: Connects the gate of the Q201 load FET to the U201 amplifier.
J204	1-2	1-2: Connects the gate of the Q202 load FET to the U202 amplifier.
J206	1-2	1-2: Connects the gate of the Q203 load FET to the U203 amplifier.

GPIO Quick Start

There are two GPIOs (GPIO0 and GPIO1) that can serve either as standard GPIOs or in their alternate functionalities. On-board LEDs light up depending on the GPIO state. To get started with the GPIOs, follow the procedure below:

- 1) In the **GPIO** tab of the GUI, set GPIO0's Alternate Mode to 0 (SBB is Set by TV_SBB0), and GPIO1's Alternate Mode to 0 (Standard GPIO).
- 2) Set the Direction to 0 (Output).
- 3) Set the Driver Type to 1 (Push-Pull). If using 0 (Open-Drain), make sure there is a pullup resistor on the GPIO pin.
- 4) Click the **Write** button.
- 5) Set the Data Output to 1 (Logic High) and click the **Write** button. The on-board LED should light up.
- 6) Now change the Direction to 1 (Input) and click the **Write** button.
- 7) Install the appropriate shunt on J5 or J8 to connect the desired GPIO to the GUI GPIO.
- 8) From the GUI, toggle the EV Kit **GPIO**, clicking **Write** after each time. Click **Read** to observe the **GPIO Input Value** update.

Figure 7. GPIO Input Value Box in GUI

Detailed Description of Hardware (or Software)

On-Key Options

For applications that require the IC to enable with a user-interactable switch, the EV kit comes with two common types: the push-button (momentary) and the slide-switch (persistent). The active-low enable pin (nEN) has an internal pullup resistor. Select which type of switch to use with jumper J3. Refer to the MAX77643 data sheet for more information on configuring the IC for momentary or persistent switches.

Changing the Output Voltages

The GUI allows the user to change the output voltages of the SIMO and the LDO. Navigate to the “SIMO Buck-Boost” section or the “LDO” section in the GUI. Drag the “Target Output Voltage” slider until the desired output voltage is reached and click **Write**.

Electronic Load

The EV kit comes with an electronic load allowing the user to evaluate the SIMO and LDO load current capabilities. On-board circuits set the load current through the I2C interface. J201, J203, J205, J207 are used to connect the load to the output of the SBB0, SBB1, SBB2, and LDO respectively. To exercise the load transient response, remove J200 (for SBB0), J202 (for SBB1), J204 (for SBB2), and J206 (for LDO), and connect a signal generator to the gate of the load MOSFET (pin 2 of the respective header). Drive the gate with a signal between 1V (off) and 3V (fully on) to apply transients to the output of the SIMO or LDO. Note that there are 0.1Ω sense resistors with test points (called VIL_SBB0, VIL_SBB1, and VIL_SBB2) and a 1Ω sense resistor with a test point (called VIL_LDO) for a 10:1 and 1:1 conversion of load current to voltage.

Figure 9. LDO Output Voltage Section

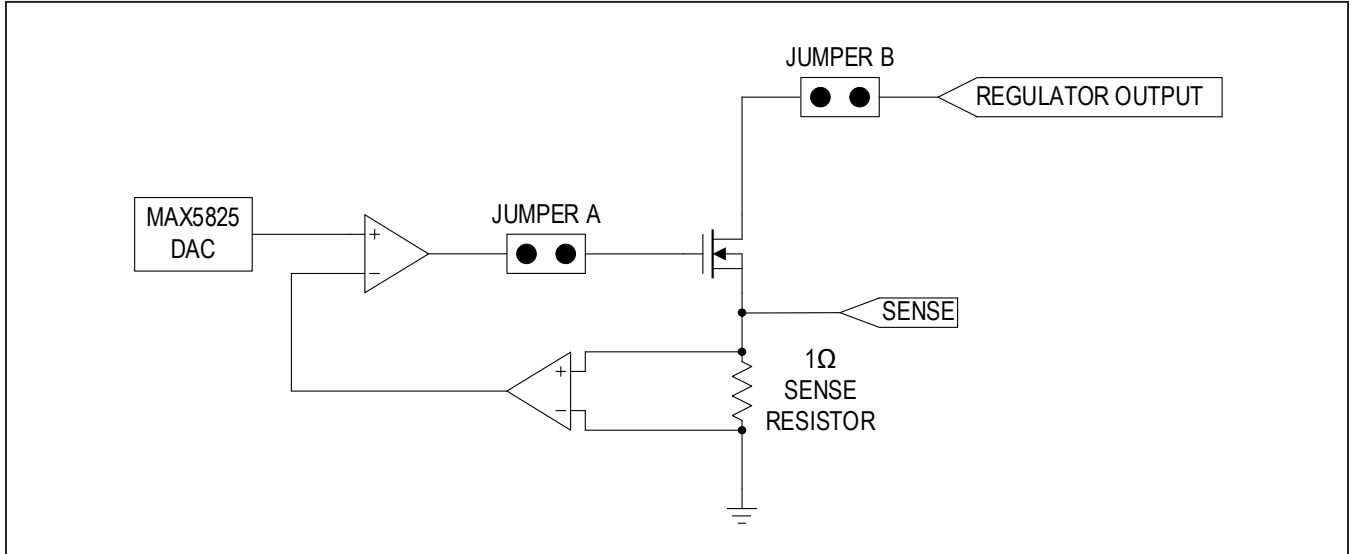

Figure 10. Electronic Load Block Diagram

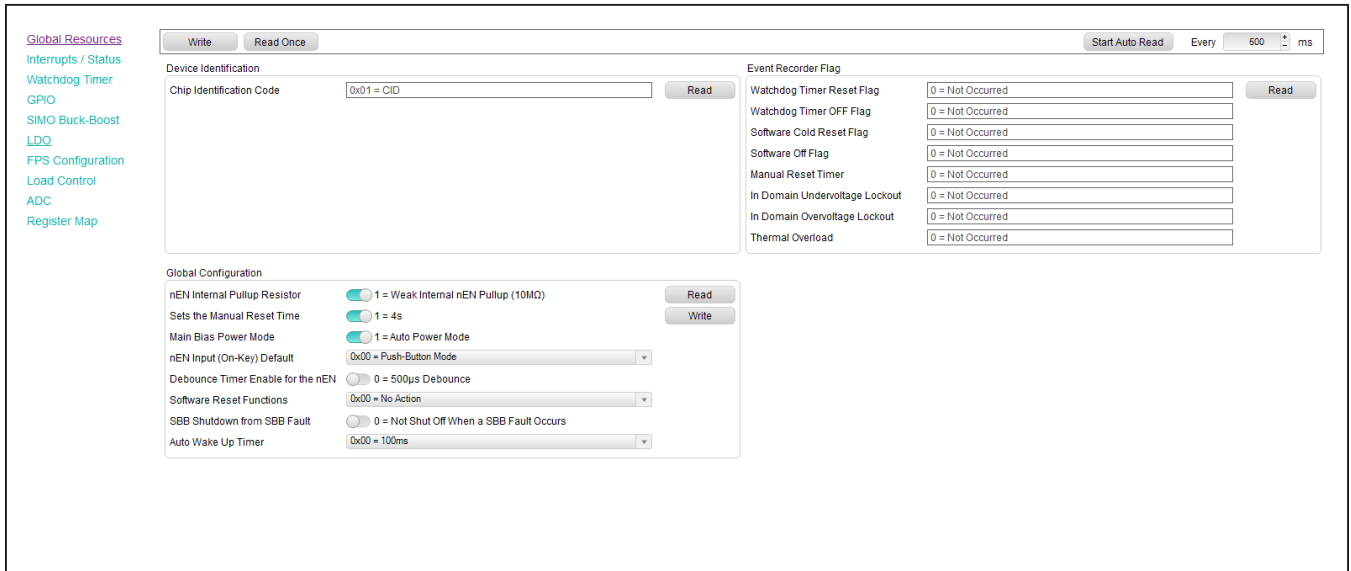

Figure 11. MAX77643 EV Kit GUI

Installation

Visit the product webpage at www.maximintegrated.com/MAX77643evkit and navigate to Design Resources to download the latest version of the EV kit software. Save the EV kit software to a temporary folder and decompress the ZIP file.

Windows Drivers

Upon connection of a Micro-USB cable between the PC and the EV kit for the first time, wait a few minutes for Windows to automatically install drivers.

Graphical User Interface Details (GUI)

The GUI drives I²C communication with the EV kit. Every control in the GUI (excluding the **Load Control** tab) corre-

sponds directly to a register within the MAX77643. Hover the cursor over the control names for a description of that register. Refer to the MAX77642/MAX77643 data sheet for the complete register map.

Load Control Tab

The **Load Control** tab contains controls for load currents on the regulator outputs. The GUI is capable of setting steady-state, transient, and random load currents. To set a load current, use the slider bar or text field to input a value (mA) and check the **Enable** box. Shuffle through the modes to exercise different load conditions.

The offset and gain values are set by Maxim and do not need to be altered.

MAX77643 EV Kit Schematics

Part Number	Configuration	7-bit	8-bit Write	8-bit Read
MAX77643 (PMIC)	ADDR OTP bit set for 0	0x40 0b100 0000	0x80 0b1000 0000	0x81 0b1000 0001
MAX77643 (PMIC)	ADDR OTP bit set for 1	0x48 0b100 1000	0x90 0b1001 0000	0x91 0b1001 0001
MAX77643 (PMIC)	Maxim internal test mode	0x49 0b100 1001	0x92 0b1001 0010	0x93 0b1001 0011
MAX11614 (ADC)	N/A	0x33 0b011 0011	0x66 0b0110 0110	0x67 0b0110 0111
MAX5825 (DAC)	ADDR1=ADDR0=VDDIO	0x1F 0b001 1111	0x3E 0b0011 1110 0x10 * 0b0010 1000	0x3F 0b0011 1111
AT24CS02 (EEPROM)	A0=A1=A2=GND	0x50 ** 0b101 0000	0b1010 0000	0b1010 0001

*MAX5825 ALSO RESPONDS TO AN I2C BROADCAST ADDRESS 0b0010 1000

**AT24CS02 ALSO RESPONDS TO 0b1011 0001 FOR READING THE SERIAL NUMBER
