MAX98390 Evaluation System

Evaluates: MAX98390 (C/D)

General Description

The MAX98390C/D evaluation system (EV system) evaluates the MAX98390C or the MAX98390D boosted Class D audio amplifier with integrated Dynamic Speaker Management™ (DSM) IC. DSM senses the voltage and current at the load and uses patented Maxim algorithms to unlock the full potential of the speaker. The EV system comprises the MAX98390C or the MAX98390D Development Board (DEV board), Maxim's Audio Interface Board III (AUDINT3), 5V power supply, reference microspeaker, USB cable, DSM Sound Studio software, and MAX98390 evaluation software.

It is recommended that the DEV board be evaluated with the AUDINT3 board as an EV system. MAX98390C/D supports standard I2S, left-justified, and TDM digital audio interfaces, as well as I2C for control.

The AUDINT3 board provides 1.8V DVDD, USB-to-PCM, and USB-to-I2C interfaces that are needed to evaluate the DEV board, requiring only a single external power supply for VBAT. The *Simplified EV System Block Diagram* details the DEV board and the AUDINT3 board.

The easy-to-use DSM Sound Studio software has a simple, yet powerful graphical user interface (GUI) that breaks down the DSM design process into three basic steps: extract, tune, and evaluate. Additionally, DSM Sound Studio provides for a 7 minute quick demo to hear the DSM difference using the included reference microspeaker.

There is also the MAX98390 evaluation software that provides complete access to all hardware registers.

Features

- Complete Hardware System with Easy Setup, No Tools or Special Equipment Required
- Precharacterized Reference Microspeaker Included
- Easy-to-Use Graphical User Interfaces Software (Windows® 7/10 Compatible)
- DSM Sound Studio
  - Quick Demo Using Included Speaker
  - Extract: Speaker Parameter Extraction
  - Tune: Full Acoustic Tuning Suite
  - Evaluate: Compare Different Tunings
- MAX98390 Evaluation Software
 - Complete Access to All Hardware Registers

EV System Contents

- MAX98390C or MAX98390D development board
- Audio Interface Board III
- 5V power supply, 100V to 240V
- Micro-USB cable
- Reference micro speaker
- Temporary adhesive for mounting microspeaker to DEV board

Ordering Information **appears at end of data sheet.**

Simplified EV System Block Diagram for MAX98390C
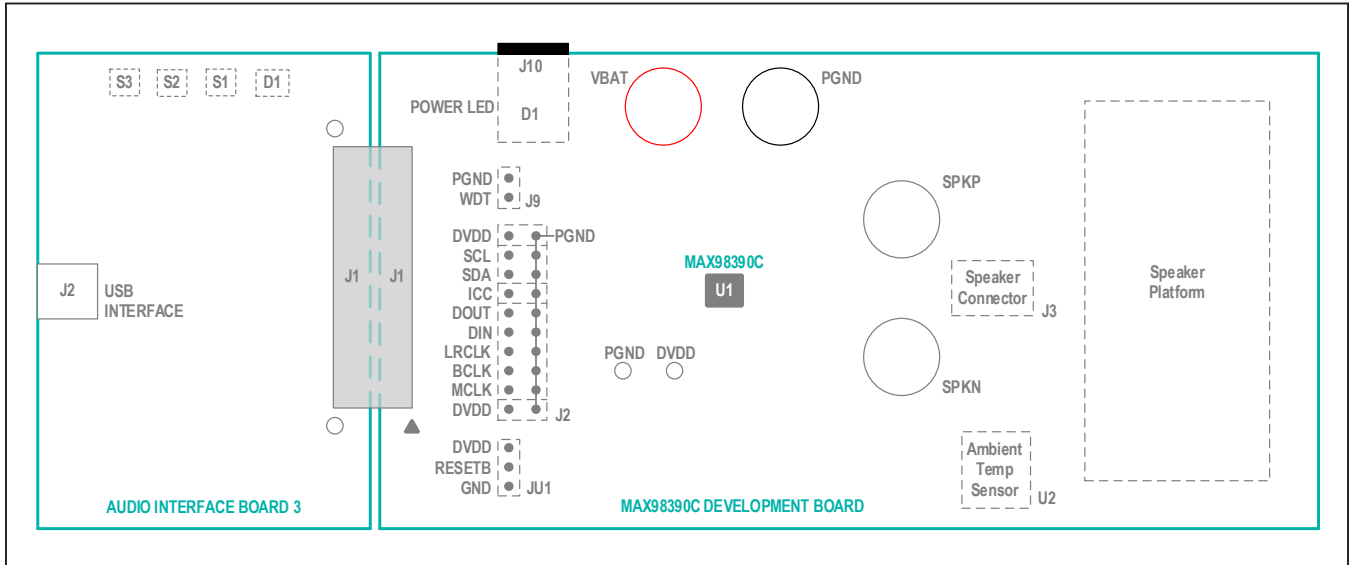

Simplified EV System Block Diagram for MAX98390D
Software Installation

1) For the latest software, login to your MyMaxim account at **maximintegrated.com** and navigate to MAX98390 > Design Resources > Software. Download DSMSoundStudio_vx.x.xx.zip, and MAX98390EVSwSetupvx_x_x.zip. Extract each compressed folder by first selecting the folder, click and hold (or right-click) the folder, select Extract All, and then follow the instructions.

2) Install the DSM Sound Studio software on your computer by running the program installer DSMSoundStudio_vx.x.xx.msi. Follow the installer prompts to completion. The application icon, labeled as DSM Sound Studio, is located under **Windows** > **Maxim Integrated**.

3) Install the MAX98390 Evaluation Software by running the program installer MAX98390EVSwSetupvx_x_x.exe. Follow the installer prompts to completion. Windows might display a message indicating that this software is from an unknown publisher. This is not an error condition and it is safe to proceed with the installation. The application icon is located at **Windows** > **Maxim Integrated**.

Quick Start Guide

DSM Sound Studio GUI

It is highly recommended to start with DSM Sound Studio. DSM Sound Studio is an easy to use GUI that will walk the user through a quick DSM demo, speaker parameter extraction, acoustic tuning of all the DSM features, and provide for rapid comparison of various tuning profiles. DSM Sound Studio also shows the user how to properly set up the hardware. Refer to *DSM User Guide* **https://www.maximintegrated.com/en/design/technical-documents/userguides-and-manuals/dsm-user-guide.html** for more information.

To launch the DSM Sound Studio application, navigate to **Windows > Maxim Integrated** and click on the **DSM Sound Studio** application icon.

To set or modify the device's hardware configurations such as sample rate, boost parameters, or brown-out detection use the MAX98390 evaluation software (see the *MAX98390 Evaluation Software*).

MAX98390 Evaluation Software

Required Equipment

- MAX98390C or MAX98390D EV system
  - Audio Interface Board III
  - 5V power supply
  - Micro-USB cable
  - Microspeaker with enclosure
- USB audio source
  (e.g., Windows Media Player® or iTunes®)
- User-supplied Windows 7 or Windows 10 PC with an available USB port

Required Software

- MAX98390 evaluation software application. If not already installed, see the *Software Installation* section.

Note: In the following sections, software-related items are identified by bolding. Text in **bold** refers to items directly from the evaluation software. Text in **bold and underlined** refers to items from the Windows operating system.

Reference Material

- MAX98390C/D IC data sheet

Procedure

The MAX98390C, or the MAX98390D and AUDINT3 boards are fully assembled and tested. Follow the steps below to set up the EV system for device evaluation:

AUDINT3 Board Setup

1) Connect the DEV board (J1 connector) to the AUDINT3 board (J1 connector).

2) With the audio source disabled, connect the USB cable from your computer to the USB port (J2) on the AUDINT3 board. The AUDINT3 board provides the power for DVDD, sourcing 1.8V to the DEV board through the J1 connector.

3) The multicolor LED D1 blinks white. When the computer registers the AUDINT3 as a USB device D1 changes to magenta and blinks slowly.

DEV Board Setup

1) With the 5V power supply unpowered, insert the DC power jack into the DC power connector (J10) located underneath the DEV board.

2) Connect the micro speaker leads across the SPKP and SPKN binding posts. Alternatively, use the spring connector terminal (J3) by pressing down the orange tab and inserting the bare speaker wire into the round holes of the connector, releasing the tab to allow the connector to grip the wire. A nonpermanent adhesive is included with the MAX98390C/D evaluation system and can be used to mount the microspeaker to the DEV board on the open space marked with the speaker symbol. The adhesive helps keep the speaker from rattling on the board during the evaluation. Be careful not to

---

Windows Media is a registered trademark and registered service mark of Microsoft Corporation.
iTunes is a registered trademark of Apple, Inc.

cover any holes in the speaker enclosure when mounting using the temporary adhesive. It is common for microspeaker enclosures to include small holes for pressure equalization.

3) Place the shunt on jumper JU1 across pins RESETB and DVDD.

Test

1) Insert the 5V power supply into a wall receptacle.

2) Launch the MAX98390 evaluation software and wait while the software connects to the EV system (Figure 1).

3) Once the connection is established, the status bar at the bottom of the GUI window should report **USB Connected** and display MAX98390 and revision ID. After the EV system is fully connected, configure the device by loading the **usb_audio_48kHz.98390** configuration file. This file can be loaded from **File, Load Register Settings, Pre-Installed Configuration Files.** Scroll down to select. Progress of the register writes can be seen in the Status Bar as a green progress bar, wait for the writes to complete before operating the device.

4) Access the Windows Sound settings by **Settings > System > Sound**. Select the output device to be Maxim AUDINT003, it should appear as Speakers (3-Maxim AUDINT003 ADC1.0) or something similar, see Figure 2. On the same page, click on **Sound Control Panel > Playback** tab and ensure that the Default Device is set to Speakers (3-Maxim AUDINT003 ADC1.0) or something similar, as shown in Figure 3.

5) Adjust the audio source volume to a low level.

6) Enable the audio source and verify that audio is heard through the connected speaker. Adjust the audio source volume as needed.

7) Quick start of the evaluation software is now complete.

Detailed Description of Evaluation Software

The MAX98390 evaluation software is designed to be used only with the MAX98390C/D EV system. The software provides an intuitive GUI for programming the device and includes many features intended to aid in evaluation.

The MAX98390 evaluation software main window (Figure 1) is composed of four main sections: menu bar, communication tool bar, tabbed pages, and a status bar. The menu bar provides additional features to aid evalua-

tion, the toolbar provides basic functionality for communicating with the device, and the status bar provides information about hardware connectivity and communication status. The tabbed pages make up the bulk of the GUI and provide the controls for programming the device's hardware registers.

The **Block Diagram** tab provides access to all the device registers using dialog windows, which contain GUI controls for configuring the device. The dialog windows are opened by clicking on the blocks in the block diagram. The **Control Registers** tab provides direct access to the valid registers from 0x2000–0x23FF, as well as to the revision ID register, 0x24FF. The **DSP Registers** tab provides access to the registers for the 8-band equalizer, the dynamic range compression, the voice coil thermal protection, and the speaker excursion protection. The **Log** tab provides a log of the I^2C transactions and a tool to read specific registers.

The MAX98390 evaluation software is compatible with Windows 7 and Windows 10 and can be found on Maxim's website. Refer to the MAX98390C/D data sheet for device register information.

Connect Sequence

When the evaluation software starts for the first time, the program automatically connects to the EV system and attempts to connect to the USB control interface on the AUDINT3 board first. Once that connection is established, it searches for all I^2C addresses associated with the MAX98390C/D device and populates all detected device addresses in the **Active Device** drop-down list. During this sequence, the text on the **Connect** button automatically changes from **Connect** to **Disconnect**, and the status bar is also updated to reflect the current state of the hardware connection.

Once the EV system is fully connected, the button displays **Disconnect**, and when clicked, it disconnects the software from the hardware. The software can also be disconnected from the hardware by selecting **Device | Disconnect** from the menu bar.

There are two methods to reestablish a connection with the hardware. The first is by selecting **Device | Connect** from the menu bar. This instructs the program to connect to the EV system. The second method is to click the **Connect** button until it displays **Disconnect**, which signifies that the EV system is fully connected.
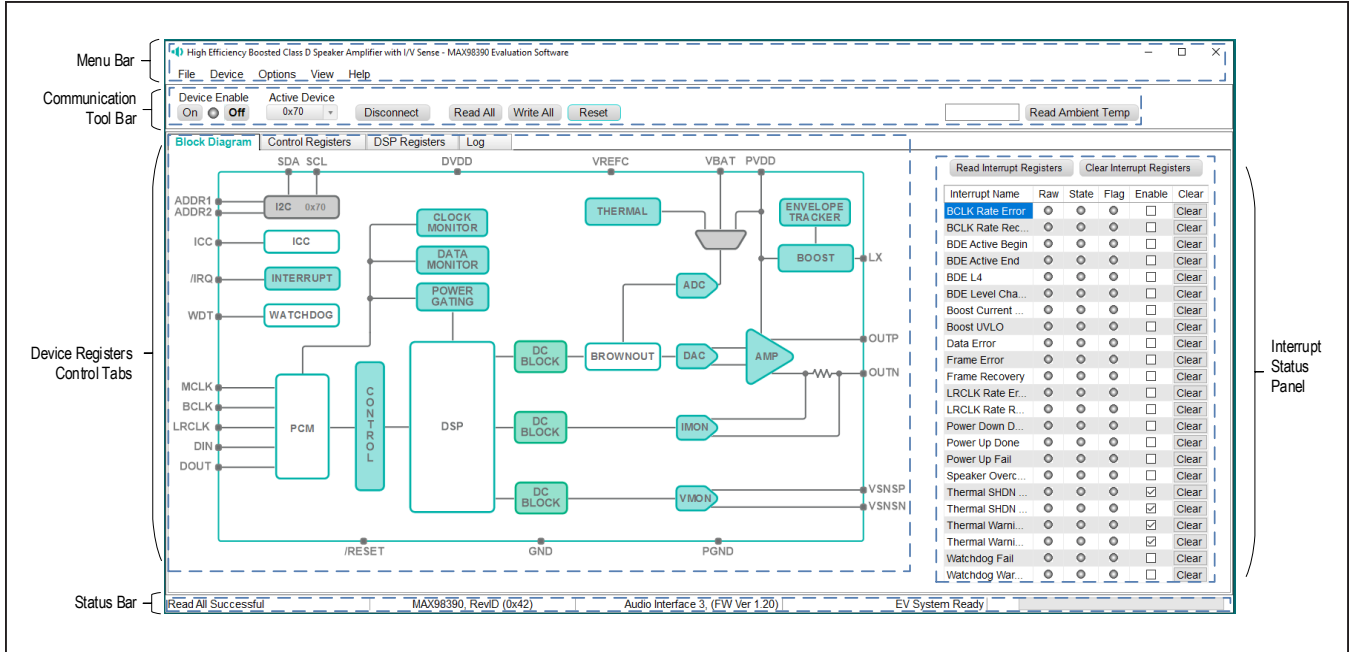

Figure 1. MAX98390 Evaluation Software

Figure 2. Windows Sound Settings

Figure 3. Playback Device

Communication Tool Bar

The tool bar consists of seven buttons, a drop-down combo box, and a display box. These controls are always accessible, regardless of the active tabbed page. The tool bar is shown in Figure 4 and Table 1 provides details about each control.

Status Bar

The Status bar is divided into four sections. From left to right: status and alert messages, device part number and revision ID, interface name and firmware version, and evaluation system connection status.

Interrupt Status Panel

The Interrupt Status panel (not to be confused with the Status bar) displays the state of the **Raw**, **State**, and **Flag** interrupts. This data is read from the Raw_, State_,

and Flag_ interrupt registers (0x2002–0x200A). When the image is red, it indicates that the associated interrupt bit has been set.

The panel also includes checkboxes for each interrupt that are used to enable the link between an interrupt's Flag bit and State bit. When enabled, the Flag bit is set whenever the State bit is set. To clear the State and Flag bits, click on the interrupt's associated **Clear** button.

Note:

- Each interrupt source must be enabled for the FLAG column (i.e., flag bits) to be set.
- The IRQ_EN bit needs to be set for the interrupt to be output on the IRQ pin.

Figure 4. Communication Tool Bar

Table 1. Communication Tool Bar Controls

CONTROL	FUNCTION
On	Press to set the Global Enable bit (EN). This enables the device.
Off	Press to clear the Global Enable bit (EN). This disables the device. **Note:** The software can communicate with a disabled device, as long as its I^{2}C interface remains active.
Active Device	Provides a list of detected I^{2}C addresses. The displayed address is the active device.
Connect/Disconnect	See the *Hardware Connection* section for additional details.
Connect	Detected addresses are shown in the **Active Device** drop-down list.
Disconnect	Press to disconnect from the USB control interface.
Read All	Press to initiate a read of all device registers. The **Control Registers** and **Block Diagram** tabs are updated to reflect the read data.
Write All	Press to initiate a write to all device registers, using the settings shown on the **Control Registers** tab.
Reset	Press to reset device registers to their power-on-reset (POR) state.
Read Ambient Temperature	Press to read the ambient temperature of the application board from external temperature sensor U2. The temperature in degrees Celsius is displayed in the display box to the left. This sensor measures the ambient temperature of the board and is used by the DSM Sound Studio software to set the room temperature value of a tested speaker.

Block Diagram Tab

The evaluation software uses an interactive block diagram to facilitate the programming of the device. The block diagram also provides a visual representation of the device's functions and current configuration.

There are three types of blocks in the block diagram, and they are identified by the cursor image. The cursor changes to a pointing hand when over a block that opens a dialog window and a full hand to toggle a function. If the cursor does not change when over a block, then it is an inactive block, and is only provided for illustrational purposes.

The color of a diagram block changes depending on the enabled state of the device function(s) associated with that block. An inactive block is grey, a disabled block is white, and an enabled block is teal. Figure 5 shows the block diagram with the device configured for digital audio interface (DAI) (USB audio) input and speaker output.

Dialog Windows

Dialog windows are associated with specific blocks in the block diagram and contain the controls for configuring the registers associated with that functional block. Open a dialog window by clicking on a dialog block. Figure 7 shows the typical GUI controls that are found on a dialog window.

Figure 5. MAX98390 Block Diagram (USB Audio Input to Speaker Output)

Figure 6. Control Register Tab

Control Registers Tab

The **Control Registers** tab provides two methods for configuring the device. As an example, Figure 6 shows the elements of the interrupt registers.

The first configuration method involves clicking on the register's bit labels. A non-bold bit label indicates that the bit is currently set low. A bold bit label indicates that the bit is currently set high. Clicking on a bit toggles its state and results in a write to that register. This action also updates the value displayed in the register's edit box, located to the right of the bit labels.

The second configuration method involves entering a hex value in the register's edit box and then pressing

the **Enter** key; the software automatically configures the device register once the **Enter** key is pressed. The state of the bit labels are then updated to reflect the value shown in the edit box.

Note: Trying to write to a read-only bit by clicking/toggling its label or entering a hex value in its edit box updates the GUI, but it does not affect the bit's value in the device. All read-only bits are updated to reflect their current value in the device by performing a read all operation.

All changes made on this tab are reflected on the **Block Diagram** tab and on any open dialog windows.

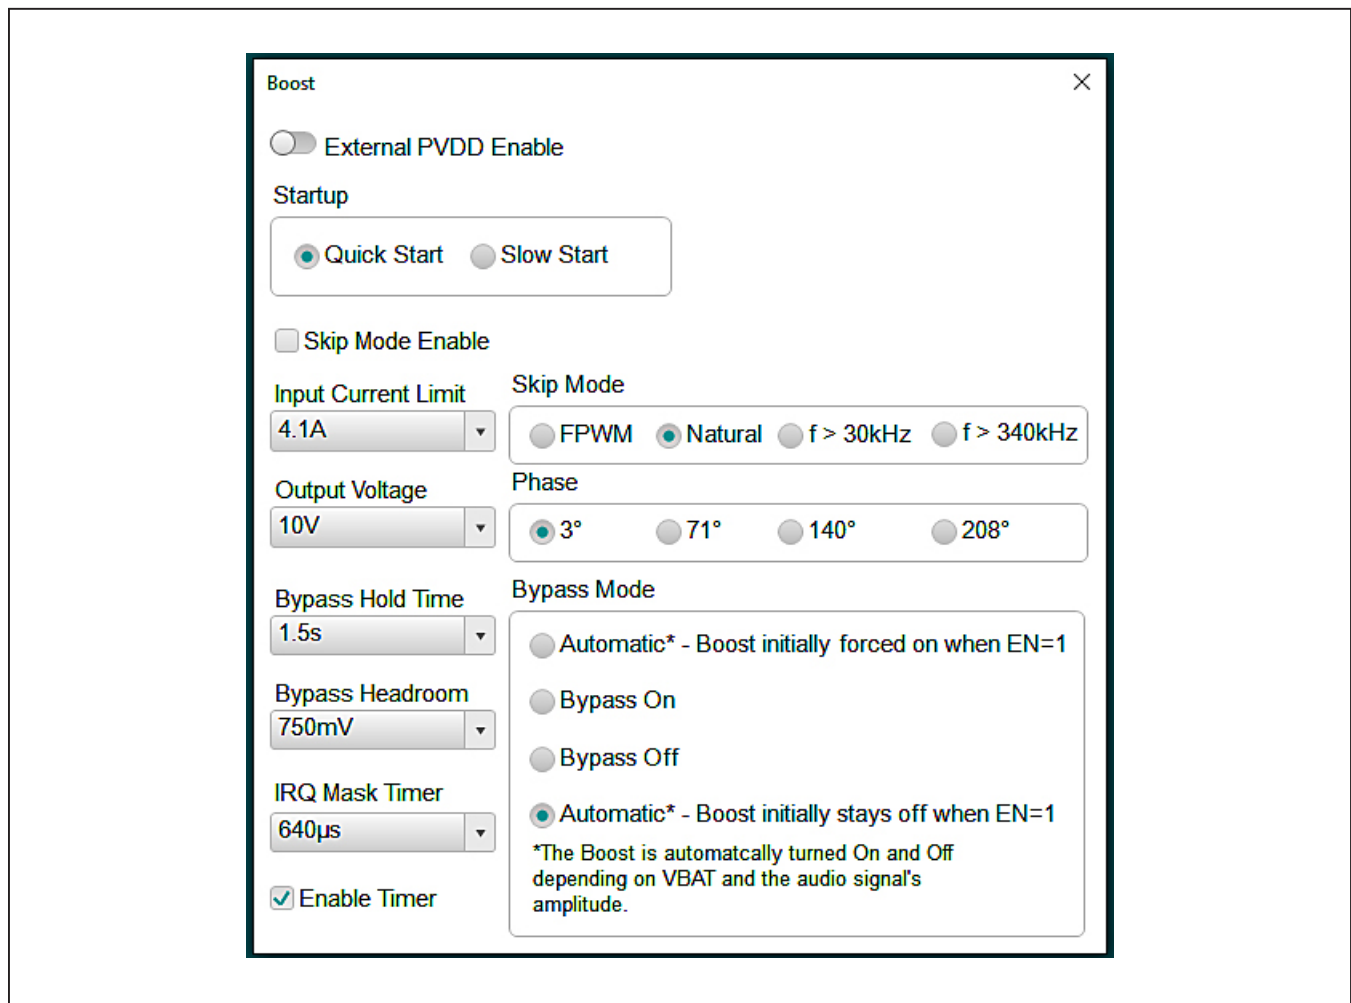

Figure 7. Typical GUI Controls

Menu Bar

Table 2 describes all menu bar items with additional information for some menu items provided in the following sections.

File I/O

The software's save and load features are accessed from the **File** menu. The **Save Control Register Settings** feature saves the data currently displayed on the **Control Registers** tab.

A configuration file's main purpose is to capture the current state of the device's registers, as displayed on the register tab. This feature makes it easy to program a device to a saved/known state and allows for the sharing of configuration files between users. To facilitate usage, use descriptive file names when saving a configuration file.

The save and load features are functional even when the hardware is not connected. This allows configuration files to be created and opened when hardware is not available. Since the configuration file is automatically generated by the software, it is not meant to be manually formatted and doing so may cause file loading issues. To open a configuration file for viewing purposes only, use a plain text editor.

Select **File > Save Control Register Settings** to create a configuration file. The register address and its data are saved as tab-delimited values and the file is saved with a .98390 extension.

The software has a couple standard configuration files pre-installed. A file can be loaded by selecting **File > Load Register Settings > Pre-Installed Configuration Files**, and using the drop-down menu, select the file, then clicking **Load**.

Table 2. Menu Bar Items

MENU ITEM	DESCRIPTION
FILE	
Load Register Settings	Loads a configuration file (as saved by the **Save Control Register Settings** option or a factory preinstalled file).
Save Control Register Settings	Saves a configuration file containing the current device settings.
Exit	Closes the MAX98390 evaluation software.
DEVICE	
Connect	Runs a connection routine to connect to the evaluation system. First, establish a connection to the AUDINT3 board and then establish a connection to the MAX98390C/D.
Disconnect	Disconnects the PC from the EV system.
Reset	Resets all control registers to their power-on-reset (POR) states.
Read All	Performs a read from all registers and updates the GUI.
Write All	Performs a write to all writeable registers, using the values show on the **Control Registers** tab and then updates the GUI.
Read Rev ID	Reads the device's revision ID register and updates the status bar.
OPTIONS	
Audio Interface 3 (Advanced Users) F3	Opens a dialog that allows the digital clocks from the AUDINT3 to be enabled or disabled. This allows the user to apply external clocks to the MAX98390C/D without conflicting with the clocks from the AUDINT3.
Interface Selection	Selects the I^{2}C hardware interface to either the audio interface or an I^{2}C bridge (not supported).
Configuration Mode F4	Opens a dialog that allows multiple MAX98390C/D devices to be selected for configuration through the software. This feature is available only when more than one active device is detected.
Activate Demo Mode	Puts the software in demo mode.
VIEW	
Communication Log	Toggles the Log sheet display in the Device Registers Control Tabs.
HELP	
View Help	Links to technical documents.
About	Provides information about the MAX98390 evaluation software.

Detailed Description of Hardware

The MAX98390C/D EV system is designed to allow for a thorough evaluation of the MAX98390C/D boosted Class D audio amplifier IC with integrated Dynamic Speaker Management. The EV system includes either the MAX98390C or the MAX98390D development board (DEV board), Maxim's Audio Interface Board III (AUDINT3), 5V power supply, and a microspeaker.

The DEV board can be evaluated as a standalone board that is driven directly by audio test equipment, powered by multiple external supplies, and configured by an external I^{2}C capable controller. To simplify the evaluation, the DEV board can be evaluated with the AUDINT3 board and the included 5V power supply. This hardware combination provides an easy-to-use method for exercising the capabilities of the device with no additional audio equipment.

The AUDINT3 board provides an on-board LDO regulator, USB-to-PCM, and USB-to-I^{2}C interfaces. The AUDINT3 LDO regulator is used to power the device's DVDD supply rail through connector J1. The USB-to-PCM converter accepts a USB audio stream from a USB connected computer and converts that into an I^{2}S data stream, allowing for USB audio playback through the MAX98390C/D device. The USB-to-I^{2}C interface is the bridge that allows the evaluation software to configure, monitor, and control the I^{2}C capable devices on the DEV and AUDINT3 boards.

Ambient Temperature Sensor

A temperature sensor, DS7505, is included on the DEV Board. The sensor is connected to the I^{2}C bus, permanently set to address 0x90, and is used by the DSM Sound Studio software to measure the ambient room temperature.

Measuring Quiescent Current

To accurately measure the quiescent current of the MAX98390C/D, the power LED and temperature sensors can be temporarily disabled by removing resistors R25 and R29. The AUDINT3 should be disconnected from J1, and DVDD (1.8V) must then be powered by an external power supply. I^{2}C control and PCM audio can then be connected using J2 on the DEV board. To return to normal operation, reinstall R25 and R29.

Power Supplies

The DEV board requires at least two external power supplies when evaluated as a stand-alone board. The power supplies and their ranges are listed in Table 3. The external supply voltages can be connected at the respective supply test-points and/or binding posts. When using the AUDINT3 board, connect the included 5V power supply to VBAT (J10). The AUDINT3's on-board LDO regulator powers DVDD on the DEV board. This power is routed to the DEV board through the J1 connector. See the *Digital Audio Interface* section.

Jumper Selection

The DEV board includes jumper JU1 to facilitate a device reset. Table 4 describes the JU1 configuration options. **Note:** Before starting evaluation, ensure that the jumper is configured as needed.

Digital Audio Interface

The device DAI is routed to interface header J2 as well as the AUDINT3 connector J1. The interface headers provide easy access to the device's PCM bus and the AUDINT3 connector allows for USB audio to be streamed onto the DEV board. See the *USB Audio Input* section for details on USB audio streaming and Table 6 for the connector J1 pinout.

DAI Header

The DAI header (J2) provides access to the MAX98390C/D master clock (MCLK) input, as well as its PCM bus (BCLK, LRCLK, DIN, and DOUT). This DAI header facilitates evaluation with audio equipment I/O. See Table 5 for the pinout of the DAI headers and Figure 8 for an illustration of how the MAX98390C/D DAI interface is routed through the DAI headers to the AUDINT3 connector.

Table 3. Power Supplies

POWER SUPPLY	RANGE (V)
VBAT	2.65V to 5.5V
DVDD	1.71V to 1.89V

GND	37	ICC	38	MCLK	39

NOTE: MCLK IS NOT REQUIRED FOR OPERATION AND IS ONLY USED IN MASTER MODE
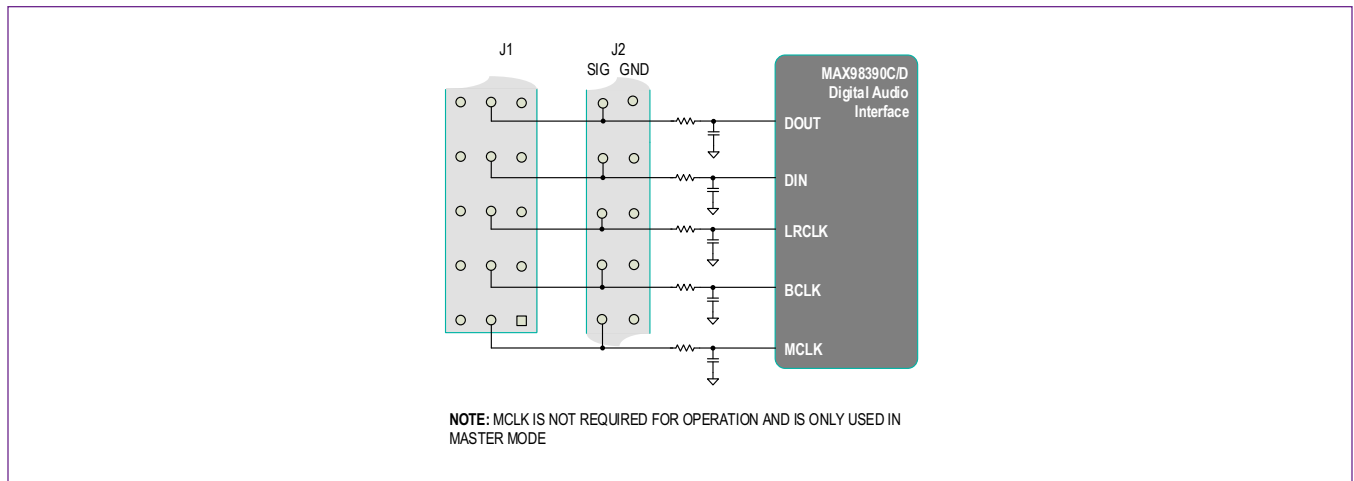

Figure 8. MAX98390C/D DAI Interface Headers (PCM)

Watch Dog Timer

Header J9 is present only on the MAX98390C Development Board. It is used to connect the external signal for the hardware mode of the watch dog function. J9 may be left open or shorted if the function is not enabled. See Table 7 for the pinout of header J9.

Table 7. Watch Dog Timer Header

SIGNAL	PIN	PIN	SIGNAL
GND	1	2	WDT

Speaker Output

The MAX98390C/D audio output is routed to the SPKP and SPKN connections on the DEV board. The DEV board is, by default, assembled to allow the MAX98390C/D output to connect directly to a speaker load without the need for filtering.

EMI Filter

When long speaker cables are used with the MAX98390C/D output, a ferrite bead plus capacitor filter can be installed to prevent excessive EMI radiation. Although it is best to choose filter components based on EMI test results, the combination of 680pF capacitors (C11, C12) and Murata BLM18SG331TN1 ferrite beads (FB1, FB2) generally work well. Before adding the filters to the design, first remove the small PCB traces shorting FB1 and FB2 (see the *MAX98390C EV Kit Schematic* and the *MAX98390C EV Kit PCB Layout Diagrams*).

I^{2}C Interface

The MAX98390C/D's I^{2}C interface is routed to header J2 and connector J1. The J1 connector is for the AUDINT3 board and connects the device's I^{2}C interface to the I^{2}C interface of the AUDINT3 board. This connection allows the MAX98390 evaluation software to read and write to the device. See Table 8.

A portion of header J2 allows for an external I^{2}C controller to connect to the device's I^{2}C bus. See Table 8.

Device Address

The MAX98390C/D I^{2}C device address can be configured to one of eight values: 0x70 (default), 0x72, 0x74, 0x76, 0x78, 0x7A, 0x7C, or 0x7E. The device address is set by connecting the device's ADDR1 pin to GND, SDA, SCL, or DVDD and ADDR2 pin to DVDD or GND. This is accomplished by installing 0Ω resistors in one of the R13-R16 locations for ADDR1 and one of the R20-R21 locations for ADDR2. For proper address programming, only one resistor is used for each ADDR pin. R13–R16 and R20–R21 are located on the bottom side of the board and are identified with silk screen. See Table 9 for all I^{2}C slave address options.

Audio Interface Board III

Maxim's Audio Interface Board III (AUDINT3 board) facilitates the evaluation of the DEV board by providing a set of features that can be used to exercise the capabilities of the DEV board without the need for additional audio

equipment. The main components of the AUDINT3 board are LDO supply voltages and USB-to-I^{2}C and USB-to-PCM interfaces. The supply voltages allow the DEV board to be evaluated with minimal amount of external supplies. The USB-to-PCM converter allows any computer to be used as an audio source for the DEV board's digital audio PCM interface, and the USB-to-I^{2}C interface allows for the use of the MAX98390 evaluation software, making device configuration and monitoring simpler.

The DEV board connects to the AUDINT3 board through connector J1. The physical connections made between the DEV board and AUDINT3 board are listed in Table 6.

USB Audio Input

To utilize the USB streaming feature of the AUDINT3 board, connect the USB cable from the computer to the micro USB connector J2 on the AUDINT3 board and ensure that the AUDINT3 board is connected to the DEV board.

Once the hardware is ready, use the MAX98390 evaluation software to configure and enable the device for DAI audio playback.

R15 (SDA)	R21 (GND)	0x74
R14 (SCL)	R21 (GND)	0x76
R16 (GND)	R20 (DVDD)	0x78
R13 (DVDD)	R20 (DVDD)	0x7A
R15 (SDA)	R20 (DVDD)	0x7C
R14 (SCL)	R20 (DVDD)	0x7E

*Default position.
Note: Only one resistor for each ADDR column should be populated.

Stereo Configuration

For stereo evaluations, a stereo auxiliary kit is available that includes a modified DEV board (stereo companion board), microspeaker, power supply, and 20-pin ribbon cable. See the *Ordering Information* section.

The Stereo Companion Board differs from the DEV board in the following ways:

● I^2C address is set to 0x72.

● Ambient temperature sensor is not installed.

● J1 is not installed.

Stereo Boards Setup

1) Configure the Stereo Companion board the same as the DEV board. See the *DEV Board Setup* section.

2) Insert the keyed 20-pin ribbon cable into the J2 connector on the Stereo Companion board, then connect the other end of the ribbon cable to the J2 connector on the fully configured DEV board. The ribbon cable bridges the DVDD power to the Stereo Companion board as well as connect DAI, I^2C, and ICC; no additional AUDINT3 board is required.

3) Connect the DEV board (J1 connector) to the AUDINT3 board (J1 connector).

4) Insert the DC power jack from one power supply into the DC power connector (J10) located underneath the Stereo Companion board.

5) Insert the DC power jack from the remaining power supply into the DC power connector (J10) located underneath the DEV board.

Stereo Testing

1) Insert both 5V power supplies into wall receptacles.

2) With the audio source disabled, connect the USB cable from the computer to the USB port (J2) on the AUDINT3 board.

3) The multicolor LED D1 on the AUDINT3 blinks white. When the computer registers the AUDINT3 as a USB device D1 changes to magenta and blinks slowly.

4) Launch DSM Sound Studio and follow the prompts.

5) For further refinement of the hardware configuration, launch the MAX98390 evaluation software. To select a device to configure, use the **Active Device** pulldown menu located in the top banner of the GUI. Once a device is selected, click the **Read All** button to refresh the settings of the GUI.
